TOTAL PILLOW SOLUTION

## ADVANCED FIBER PROCESSING

Filling materials require a preparation before being ready for the following filling step. Pillows are filled with dedicated filling materials or blend of them: fiber bale opener and fine fiber opener are key machines. On top of that a grinder for reusing foam and other wasted materials is an option. All filling materials can be stocked and mixed by using Borsoi silo and mixing units before being used in the next part of the production process.

## TEXTILE PADDED FILLING SYSTEMS

The pre-weighing and filling process is a key step in the production line where filling material is filled inside the pillow shell. Different machine configurations are available for satisfying different output needs and automation degrees. Borsoi unique pre-weighing technology is known for very good accuracy, fast production rate and extreme flexibility. Those parameters give you a competitive advantage in terms of return of investment.

## CLOSING MACHINES AND PACKAGING

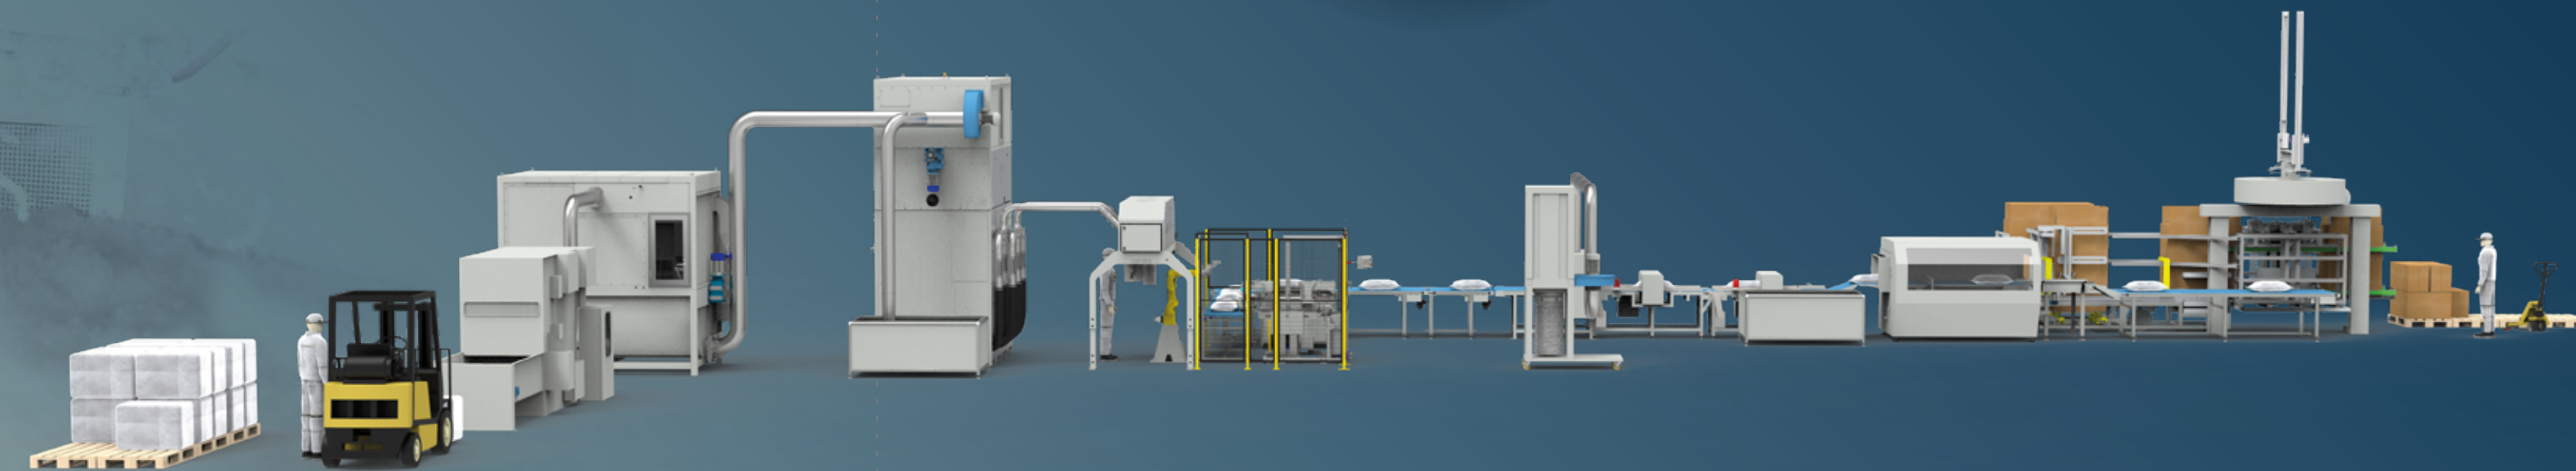

The closing, levelling and packaging area is the part of the production line where pillows are closed and prepared for the market. Overlock, lockstitch and ultra-sonic welding are possible options for closing pillows. A complete machine family is available for preparing the desired final packaging from a plastic bag to a carton box. We take care to balance each of our line Borsoi "Bale to Box" line approach is taking care about all production line balancing all steps and avoiding any bottleneck.
