KEEPING YOUR FILLED PRODUCTS IN THE LEAD

TOTAL QUILT SOLUTION

ADVANCED FIBER PROCESSING

Filling materials require a preparation before being ready for the following filling step. Quilts and toppers are filled with dedicated filling materials or blend of them: feather bale and fiber openers are key machines. On top of that a grinder for reusing foam and other wasted materials is an option. All filling materials can be stocked and mixed by using Borsoi silo and mixing units before being used in the next part of the production process

TEXTILE PADDED FILLING SYSTEMS

The pre-weighing and filling process is a key step in the production line where filling material is filled inside the quilt shell. Different machine configurations are available for satisfying different output needs and automation degrees. Borsoi unique pre-weighing technology is known for very good accuracy, fast production rate and extreme flexibility. Those parameters give you a competitive advantage in terms of return of investment.

CLOSING MACHINES AND PACKAGING

The closing, levelling and packaging area is the part of the production line where quilts and toppers are closed and prepared for the market. Overlock, lockstitch and ultra-sonic welding are possible options for closing preparing quilts. A complete machine family is available for preparing the desired final packaging from a plastic bag to a carton box. We take care to balance each of our line Borsoi "Bale to Box" line approach is taking care about all production line balancing all steps and avoiding any bottleneck.
