KENZO
GRAPHENE REINFORCED

Ecocoat Kenzo is our flagship coating which pioneered the 10H hardness worldwide and is the benchmark of ultra-lux ceramic coatings. IGL Coatings heavily invests in innovation and graphene reinforced **Ecocoat Kenzo** is the culmination of 3 years of intensive research and development. Synthesised using the latest nanotechnology and graphene nanoplatelets, the new and improved **Ecocoat Kenzo** is more durable and has an increased resistance against harsh weather, making it one of the most sought after coatings in the industry.

material

Benefits of ecocoat K=ENZO

Improved Hydrophobicity and Water Contact Angle

The new and improved formula raises the bar with an unmatched hydrophobicity with a water contact angle of up to 120°, creating the tight beading effect that Kenzo is renowned for. Its extreme hydrophobicity creates a better self-cleaning surfaces, repelling dirt and other contaminants easily, improving ease of maintenance.

Extraordinary Gloss and Clarity

Our signature coating is renowned worldwide for its extraordinary gloss, mirror finish and its absolute clarity. In its reformulation, we focused greatly to improve upon its strengths without any compromise its hardness or clarity, leaving Ecocoat Kenzo's unique satin soft slickness and glow unmatched.

The 100% High Solid, Zero VOC formula

Ecocoat Kenzo's formula is formulated with a higher resin concentration with Zero Volatile Organic Compound (VOC). With the reduced solvents, the coverage area significantly increases with an almost zero loss from shrinkage. When less is more. Unlike low solids formulas that require more layers, Ecocoat Kenzo achieves perfection in a simple 2-step Base and Top application.

Increased Durability and Protection

The addition of the graphene nanoplatelets improves the adhesion of Kenzo Base onto surfaces, creating a stronger and more durable coating. Tested against 70,000 scrub cycles (an evaluation to the wear and tear of a coating) the new and improved Graphene Reinforced Ecocoat Kenzo has raised its durability by 20%, to an impressive durability rating of up to 5 years, protecting your prized assets for longer.

Increased Resistance

Due to the graphene nanoplatelet's unique size and morphology, it is especially effective at providing enhanced barrier properties. This uniqueness improves the coating's mechanical properties such as stiffness, strength, and surface hardness, enhancing and increasing the coating's resistance against harsh weather, water-spotting and chemicals.
