- big brake kit
- trailer brake parts
- caliper repair kit

CME BRAKES CO., LTD

ABOUT US

CME brakes is a brake caliper manufacturer in China mainland, founded in 2006.

In the past decade, we started from a 4–person workroom to presently 30 persons, still small but effective and flexible company. Till now, we have developed about 300 models of brake calipers for passenger cars replacement use, covering most popular car makes in Europe, supplying more than ten main customers worldwide.

We keep improving our quality level little by little since we began this business, starting from reverse engineering at the early years, we now have quite mature control in making normal fist type calipers and brake calipers with parking brake system. At same time, we also cultivated our own engineer team in making brake calipers as per customer requirements, like industry use calipers and special vehicle calipers.

With the advantage of a good supply chain on brake caliper parts and other related parts, we also developed some other product units, like brakes parts for boat trailers, big brake kits for refit use, and brake components related repair kits.

It is our credo to make customer satisfied during buying from us, we always offer free replacements whenever there is problem on our products, and all our products are returnable in twelve months without any reason needed.

Give CME a chance and we will never let you down!

CME brakes

•brake caliper

CME tests every piece of the brake caliper of its appearance, rust proof performance, hydraulic function, leakage, strength etc, to ensure the overall quality to be over normal recognized standards within this field. To make a perfect brake caliper, besides all efforts we make on the machining of the caliper housing, we attach much importance on materials received from outside, from pistons to brackets, rubbers, grease, every shipment to our factory will be checked by AQL standards.

At same time, all the parts and materials CME using are complying with international standards on environment protection. All surface coatings are made by government approved sub-contractors, with proper certificates.

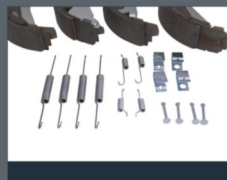

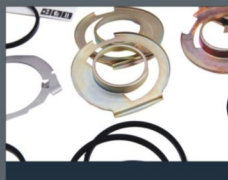

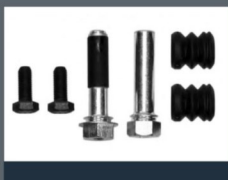

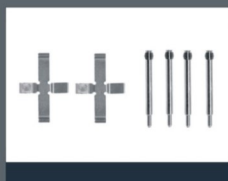

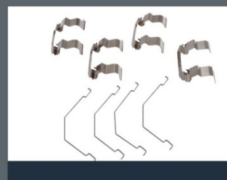

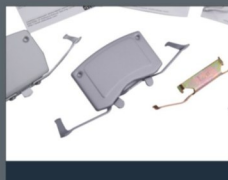

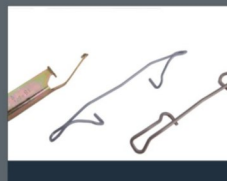

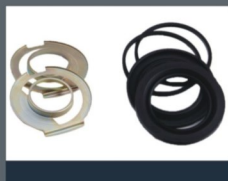

CME stocks a wide range of popular models on brake calipers, which enable us to sell at small quantity like 50 pieces. With support from those world famous logistics companies, we are able to ship our products to most main cities around the world in seven days by air.

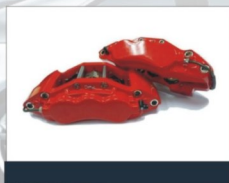

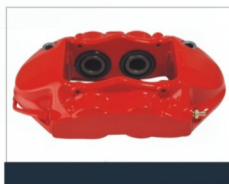

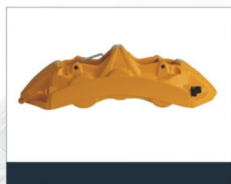

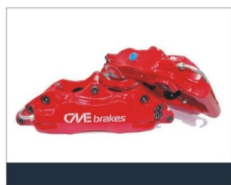

•repair kits

For all CME brake calipers, we also offer repair kits so as to meet different customer's requirements. Customer can choose to have them packed in the same package with brake calipers or have their special bag pack to sell separately. As long as customers can provide us with the OE number of the repair kits, we can match and supply, even without ordering our brake calipers.

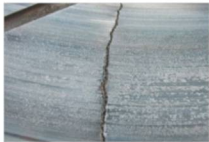

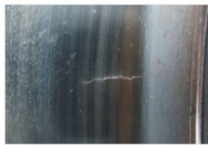

♦ tuning calipers

•high carbon brake disc

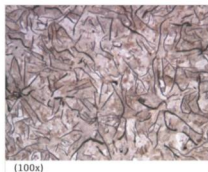

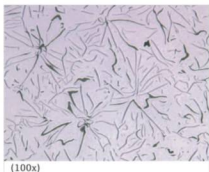

High Carbon material for brake disc

With 15 years experience in brake disc field, we have made and exported millions of brake discs to all over the world. The normal material is gray casting iron of HT250 (gg20/G3000). We all know this material is good enough for normal street vehicle use, and 80% of the brake discs made in this world is by such material. But when it comes to high performance cars, especially when it comes to track use, this kind of material will show its weakness.

CME high carbon material HC36.1

After years of studying and learning from others, we now have a high carbon material HC36.1, it is a special casting iron with some extra elements added, normally there will be Cr,Mo,Cu,or sometimes Sn. The added elements will help to dissipate heat and cool the disc body faster, to avoid excessive high temperature of the disc, so as to reduce the possibility of cracks.

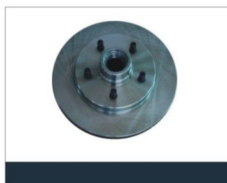

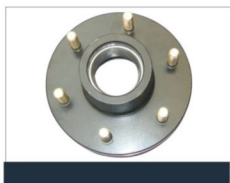

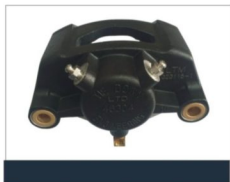

•trailer brake parts

CME brakes has been in study of "non-rust" brakes for salt water use for more than ten years. This is mainly used on boat trailers, till now we have several series of products using in different conditions for different customers.

- E-coatl series: normal steel made products with E-coat or Dacromet finish, with rust proof performance of 120 hours in neutral salty water spraying test.

- Hot-dip series: normal steel made products with hot dip coating. with rust proof performance to 500–1000 hours with different coating thickness.

- SS series: all 304 or 316 stainless steel products.
