

# INDUSTRY 4.0 – HOW IT WILL CHANGE YOUR PRODUCTION

The manufacturing industry now enters a new, revolutionizing era. This game shifter is publically known as Industry 4.0 or **"THE SMART FACTORY"**, where artificial and human intelligence together will boost profitability. In brief, it means that computers and automation come together in an entirely new and revolutionizing way. Computer systems are connected remotely to machines that are

able to learn their tasks with very little input from human operators. The physical systems become self-organizing, where every product is an active information unit, communicating and cooperating both with each other and with humans in real time via the wireless web. Artificial and human intelligence together, **WILL BOOST PROFITABILITY**. The Eton solution is already designed to make it happen.

## THE ETON CONCEPT

# INCREASED COMPETITIVENESS

The manufacturing industry now enters a new, revolutionizing era. This game shifter is publically known as industry 4.0 or **"THE SMART FACTORY"**, where artificial and human intelligence together **WILL BOOST PROFITABILITY**.

## Eton Systems – taking lead for the future

The unit production solutions from Eton are future compliant more than in a technical sense. Above all, the Eton solution will make you less exposed to competitive challenges, such as labor cost, shortage of skilled labor or productivity levels. You will also be able to offer your customers quicker and more flexible delivery.

Eton reduces work in progress from days to hours, allowing faster and more accurate control of production and quality.

## The Unit Production System – what you want, whenever you want

The unit production solution works perfectly for mass production, but also gives you an extra competitive edge through its extreme ability to quickly respond to special custom-made orders, even without disrupting an ongoing larger production batch.

Some quick changes at the loading station along with intelligent routing and you're ready to ship the custom-made order in a matter of hours. Flexible manufacturing in a true sense.

## Smart, totally flexible and modular

The Eton system is a totally flexible modular system of highest quality. Optimized to handle products carefully and efficiently with a minimum of defective output. It's a unique concept that no other competitor on the market can provide. It also has a Return of Investment that is matched by few, giving your operations a profitable head-start into the future.

## Increase floor and profitability space

The Eton system practically eliminates the need for manual handling of work in progress. Getting rid of non-productive activities like transportation and bundling, allows you to use labor, time and floor space time far more efficiently. By reducing the skill and time of the sewing operator it's easier and faster to train and cross train. All components are sequenced automatically to each work station. The loading clamp is an information carrier

giving you critical real-time information along the production line. This allows you to instantly and automatically balance and optimize the production flow, with less errors.

**An Eton solution reduces non-value added time with up to 80 %. Ask your local Eton representative how.**
