# Automatic pass-through disinfection

For foam cleaning and disinfection of floors in passing areas

**NEW**

**WALTER** 

# No chance for germs!

The innovative pass-through disinfection scores with maximum flexibility in connection

The automatic disinfection system eliminates germs before they pass the area limits.

Because a typical problem of any business with different passage areas is: dirt and germs are dragged back and forth.

## That's typical Walter!

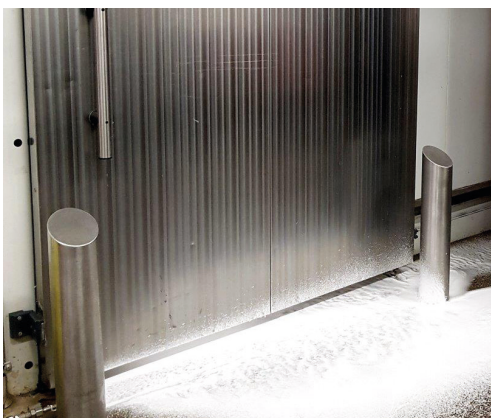

3 top advantages at a glance

/ flexible intervals

/ individual adaptability

/ environmentally friendly and practical

### The concept

The automatic pass-through disinfection is installed at the passages without major effort and connected to the existing pressure cleaning systems.

The foam disinfection system with approved injector system automatically sprays a 10 to 15 mm high foam carpet onto the floor after a certain time interval.

This carpet unfolds its disinfecting effect, thus preventing cross-contamination through wheels or shoes between the work areas.

How and for how long the spray is applied can be individually adjusted – even manual operation can be included if desired. A warning lamp signals a pending spraying interval. This way, no one runs the risk of unintentionally running into a spray.

### Scope of delivery

High/low pressure injector, chemical non-return valve, water non-return valve, time control, control according to VDE, manual push button, nozzle beam with 2 nozzles, warning lamp für people's passing area (optional)
