

Novabase srl is a multi-year experienced company, specialized in **custom industrial projects development**. Electronics, machinery operating panels, centralization and monitoring software: Novabase covers it all.

NOVABASE COVERS EVERY NEED IN TERM OF INDUSTRIAL AUTOMATION

Our experience allows us to realize completely custom solutions to meet the needs of every client. Alternatively, we can also use commercial solutions, depending on the specific case. Our portfolio includes:

- Controlling and monitoring industrial ovens for meat preparation (ham, mortadella and so on), thanks to our PLC and SCADA software for centralization and supervision;
- Development of wireless monitoring systems (temperature and humidity sensors) for environments reaching 125°C/257°F. These systems work thanks to a Bluetooth mesh networking and are realized entirely by our team, starting from the study of the electronic components and the case, up to the development of the firmware and software for data publishing via ModbusTcp protocol;

- Mobile apps development, both Android and IOS;
- Project and development of snmp monitoring systems for important Italian television broadcasters;
- Centralization of scales and development of the software for lots management, weighing recording and work optimization.

Novabase can count on a group of electronics and software experts that work as a unit. We give quick support to our clients worldwide, offering our services in Italian, English, Spanish and French, either remotely or in person. In addition to custom projects development, we offer an efficient post-sales support.
