

RENEW

A photograph of a warehouse interior. In the foreground, a worker in a grey uniform is seen from the back, holding a long-handled tool. To the right, a wooden pallet is loaded with several large cardboard boxes. Another worker in an orange safety vest is visible in the background, working near more boxes. The warehouse has high ceilings and metal shelving units filled with boxes.

Renew your floor at high speed

MC-DUR TopSpeed: From old to new in just 6 hours

EXPERTISE
FLOOR COATING

RENEW your floor at high speed

MC-DUR TopSpeed: From old to new in just 6 hours

Whether in workshops, warehouses or production areas, refreshing worn Epoxy and Polyurethane resin floors with a durable coating is usually time-consuming and involves interruptions to operations or even disruptions to deliveries. MC-DUR TopSpeed offers the perfect solution: With roller application, a highly resistant floor coating can be installed in a very short time.

Easy application saves time and money!

After the substrate has been grinded and cleaned, MC-DUR TopSpeed is applied as a primer and, in a second step, as a top coat. Done! If required, floor markings can then be applied in a single step.

Ready for traffic in just 6 hours!

Walkable after 2 hours and fully usable again after 6 hours, MC-DUR TopSpeed offers the prospect of minimal disruption to operations – or even application while operations continue.

Unlock cost savings!

MC-DUR TopSpeed is your ticket to avoiding costly disruptions, extra expenses and transport troubles. With less down-time, you will not only save time, but also protect your valuable assets.

Say goodbye to expensive floor replacements!

MC-DUR TopSpeed offers a significantly lower cost per square metre compared to renovating a floor through full replacement, making it the smart choice for refurbishing your space without breaking the bank.

Quick to install and extremely durable thanks to KineticBoost Technology®!

"TopSpeed" means accelerated curing in addition to high resistance: all system components use the influence of moisture from the environment to generate an additional, accelerated curing reaction. This modified combined reaction produces enormous adhesion to all common concrete and screed substrates. It also provides superior abrasion and scratch resistance.
