

## ScanPlant NG Inventory Management

# Improving Stock Overview

**EFFICIENT CONTROL  
FLEXIBLE HANDLING  
REDUCED GIVE-AWAY**

The ScanPlant NG Inventory Management is the flexible system that can handle inventory transactions in an unlimited number of departments or locations, as well as managing items, that are separated via unique identities or summarized in shared identities.

## Perfect overview and control

The ScanPlant NG Inventory Management handles inventory transactions in an unlimited number of departments or locations. The items are separated via unique identities (pallet numbers, box numbers etc.) or in summarized shared identities (production number, batch number etc.).

It is possible to place items on locations in multiple dimensions - departments, rows, shelves, racks and more.

The ScanPlant NG Inventory Management shows current and historic inventory, just as it is possible to sort and filter a search. All inventory reports can be exported to Excel, PDF or Word and filtering conditions, date of processing, name of report and other important information is equally exported, so that you record which data you have exported.

By integrating ScanPlant NG Quality Management, it is possible to block an item in stock and to isolate it, until it is decided whether the item should be released or discarded.

The ScanPlant NG Inventory Management can handle many forms of registration such as:

- Manual reporting (touch screen)
- Bar code (GS1, EAN etc.)
- RFID
- PDA/Tablet

The ScanPlant NG Inventory Management is available with the FIFO options (first in – first out) which ensures that the oldest products are used first in order to reduce shelf time.
