

## Introducing Rhynogrip Mesh Line

The INDASA Group have announced their new Rhynogrip Mesh Line abrasives range. This new open mesh structure abrasive is set to redefine the sanding experience by maximising productivity and virtually eliminating dust, offering a leap forward in user efficiency.

The difference Mesh Line offers is clear. The electrostatic coating provides an extra layer of resilience, ensuring that the abrasive maintains its performance even under the most demanding conditions. This innovative coating combines with a mineral grain to extend the abrasives' working life, enabling it to cut faster and for longer.

Andrew Tindall (Group Commercial Director) said "adding a mesh abrasive to our product portfolio is testament to our commitment to delivering high performing systems. We're not only expanding our abrasives range but solidifying our position as a provider of cutting edge solutions using different abrasive technologies."

The benefits of Mesh Line abrasives are twofold. Firstly, the open mesh structure prevents clogging, extending the life of the abrasive and reducing the need for frequent replacements, resulting in considerable time and cost savings. Secondly, the enhanced extraction system keeps dust contaminants out ensuring a cleaner working environment, making it safer and more efficient for the operator.

Available in a concise range of discs and strips suited for both machine and hand sanding applications. Mesh Line is ideal across a wide range of industries like decorative, woodworking, automotive refinishing, metalworking, and many more. Regardless of the task at hand, trade professionals can rely on the sanding performance and long-lasting durability of these abrasives to deliver exceptional results.

Group Technical Manager, Humberto Placido said "with the introduction of Mesh Line, we're continuing to push the boundaries of what is possible in sanding technology. We remain committed to developing innovative and high performance abrasive systems."
