

RecFaces Releases Boxed Solution for Biometrically Accurate Work Time Tracking

Dubai, November 28, 2022 – RecFaces, the market leader in ready-made facial recognition software, came up with a new product announcement. The company announced the release of the cutting-edge biometric solution Id-Time, reliable on-site logging of work time.

The product has already sparked a lot of interest among large construction companies that can notably benefit from the RecFaces new solution. In the context of business process automation, the company has released the new boxed solution Id-Time designed to optimize the work of HR departments.

Id-Time highly facilitates work time logging and analysis of compliance with labor discipline due to dealing with ready-made reports based on a reliable array of data. The basic version of the product comprises five types of reports: attendance, idling time per day, tardiness, presence hours and system fraud attempts. The completeness of this information makes HR reporting and worktime records more accurate as well as efficient.

Id-Time software solution ensures trouble-proof delivery of all push notifications, even if data transmission channels are unstable. This is possible due to the facial recognition terminals being able to operate autonomously with biometric templates preloaded into their memory, and send the information to the customer's secure server when the connection is restored.

“We can clearly see a demand for off-the-shelf biometric products that do not only tackle the problem of ghost employment, but also monitor actual hours worked. Such records are crucial when calculating labor wages since they correlate with the profit each separate employee brings to the company,” – says **Tamara Morozova, CEO of RecFaces**. “The solution has proven particularly effective in terms of monitoring contract workers and crews at construction sites, warehouse terminals and other sites with a high percentage of hired staff. Facial biometrics has been successfully helping construction business managers secure full control over their employees”.

The growing interest in time monitoring systems, including those based on facial biometrics, is largely dictated by the need for comprehensive automation. According to a [Top10VPN](#) study, global demand for employee monitoring software reached a record 78% growth in January 2022. According to the forecast of [International Data Corporation \(IDC\)](#), in 2022, the expenses of European companies on biometric systems will grow by 20% compared to 2021. Furthermore, IDC believes this trend is going to carry forward until 2026, when the cost of biometrics is expected to total \$ 6.1 billion USD.

About RecFaces:

RecFaces is one of the leaders in developing ready-to-use software products with facial recognition functions. RecFaces develops off-the-shelf solutions that help to quickly increase the efficiency of VMS, ACS, as well as ERP, CRM, and time tracking systems. RecFaces' solutions are based on a highly accurate facial recognition algorithm. RecFaces has a range of ready-made integrations with leading security system products, which helps to quickly deploy solutions on any customer equipment. Our software allows businesses to quickly, securely, and accurately identify and verify the identity of employees, customers, and visitors. The quality of RecFaces' off-the-shelf solutions is confirmed by numerous installations worldwide, including the MENA, APAC, and LATAM regions. Together with our global partners, we provide solutions for security, finance, transportation, retail, and other industries, providing free demo versions and training on company products.
