FIRAT

FIRAT was established to carry out production in the field of plastic building materials in the year 1972. FIRAT, which always sets out with the principles of "**Quality Production**" and "**Quality Products Diversity**", has succeeded in becoming both the leading establishment of the sector and the export leader of the sector as a result of significant enterprises that have taken years.

In its production FIRAT targets various sectors such as construction, agriculture, automotive, medical, domestic appliances sectors with its plastic-based products. It realizes its production targeting those sectors in its modern factories in Büyükçekmece-İstanbul and Sincan-Ankara.

FIRAT owns one of the three biggest plastic production complexes in Europe.

As of 2021 the number of personnel working in the constitution of FIRAT is 1850. Fırat which believes that the most valuable element is human always organizes in-service trainings with the aim of enhancing work experience of its employees and building up their corporate knowledge.

Product Diversity and Groups

FIRAT has a product range of over 5500 products. In order to ensure that our customers get the most beneficial and satisfactory service, Fırat products are manufactured as integrated systems (parts complementing each other).

Thousands of FIRAT products, such as PVC window and door frames, PVC gutters, PVC drainpipes and attachments, PVC hose assemblies, rubber and PE-based hoses, PPRC indoor installation pipes and attachments, PP composite pipes and attachments, HDPE pipes and attachments, PP&PE sheets, LDPE pipes and attachments, EF attachments, PE attachments, PE 80 natural gas pipes, PVC and PE drainage pipes, FKS sewage pipes, FCS pipe systems, tunnel type drainage pipes, double-walled cable protection pipes, EPDM gaskets, TPE gaskets, metal injection products (hinges and window fittings), PEX mobile piping system and floor heating pipes, PEX pipes and metal attachments, PEX-AL-PEX pipes, sprinkler irrigation pipes and drip irrigation pipes are at the service of customers in Turkey and many other points in the world.

FIRAT manufactures FKS canalisation pipe, the testable operating life of which is 100 years. These pipes which can be manufactured up to 2400 mm diameter from HDPE (high density polyethylene) raw material are resistant against ground motion, gnawing animals, plant roots and chemical wastes. FKS pipes are manufactured with German company Krah technology and licence.

Triplex pipes again manufactured in FIRAT facilities are used in out door installations and grounds as well as domestic connections, predominantly in sewer line, rain water drainage lines, industrial waste water installations, water conveying pipes and drainage systems. Triplex pipe has big advantages like high flow performance, external load resistance, long operating life, transport and storage convenience, its becoming economic, endurance against chemical substances, price and maintenance convenience, imperviousness and filter-free operation choice.

FIRAT is capable of conducting welding, heavy rain and wind resistance, blow and milled blow resistance,

compression, shear and break-off strength ring rigidity (strength of FKS and Triplex pipes against soil load) tests in its the state-of-the-art test and analysis laboratories. Our products are offered to the service of our customers only after they are confirmed by the Quality Assurance Group related to their conformity to production, sale and outlet.

After all the quality control tests are completed, FIRAT products are offered to the market with "Firat Quality Assurance Confirmation". Firat is the only company of the sector which holds international quality certificates such as GOST, SKZ, BDS, EMI, DVGW, TSE as well as ISO/IEC 17025 accreditation and all of the system certificates, which are ISO 14001, OHSAS 18001, ISO 10002 and ISO 9001. As an environmentally friendly manufacturer, Firat holds an ISO 14000 Environment Management System Certificate.

To develop, grow, struggle to achieve perfection through advanced technology and utilize all its resources in order to ensure long lasting customer satisfaction are the objectives of FIRAT.

FIRAT Administrative Building

Thousands of Fırat products, such as PVC window and door frames, PVC gutters, PVC drainpipes and attachments, PVC hose assemblies, rubber and PE-based hoses, PPRC indoor installation pipes and attachments, PP composite pipes and attachments, HDPE pipes and attachments, PP&PE sheets, LDPE pipes and attachments, EF attachments, PE attachments, PE 80 natural gas pipes, PVC and PE drainage pipes, FKS sewage pipes, FCS pipe systems, tunnel type drainage pipes, double-walled cable protection pipes, EPDM gaskets, TPE gaskets, metal injection products (hinges and window fittings), PEX mobile piping system and floor heating pipes, PEX pipes and metal attachments, PEX-AL-PEX pipes, sprinkler irrigation pipes and drip irrigation pipes are at the service of customers in Turkey and many other points in the world.

Exempting glass and screws, Fırat is the only company that manufactures all parts constituting PVC window and door systems in the world plastics sector. Since one hundred percent compatibility between the components of PVC window and door frame systems can only be achieved by producing all of these under the same roof, all PVC profiles, EPDM gaskets, TPE gaskets, reinforcement plates and metal accessories are manufactured and integrated by Fırat in its own facility

FIRAT PLASTİK KAUÇUK SAN. VE TİC. A.Ş. provides services for the PVC window sector with the brands Fıratpen, Winhouse and Gedipen, as well as the product series Selenit 75, Selenit 75 Privia, Power 75, Garnet 70, Zenia Sliding, Opal 70 and Redonit 85.

After all the quality control tests are completed, Fırat products are offered to the market with Fırat Quality Assurance Confirmation. Fırat is the only company in the sector which holds international quality certificates such as RAL, GOST, SKZ, BDS, SABS, EMI, DVGW, TSE as well as all of the ISO 14001, OHSAS 18001 and ISO 9001 system certificates.

Fırat has achieved customer satisfaction in over 70 countries with its products and has taken a significant, well-deserved position in the sector. Maintaining continuous growth and development, utilizing all resources and striving to achieve perfection through advanced technology are the objectives Fırat has adopted. The popularity of our products arises from reliability, durability, ease of access, practicality and after-sales support which result from Fırat's endeavor for perfection and excellence.

***FIRAT owns Turkey's first and only TÜRKAK accredited quality, control and test laboratory.**

Pex-Al-Pex Pipes (Multi Layer Tig Pipes)

TIG Pipes are used for warm and cold water systems, radiator systems, pressure air installations, transmission of cooled fluids, inner-building fresh water systems and floor heating systems. TIG Pipes are produced through a special technology combining the superior features of plastic and metal materials. While the inner and outer layers of TIG Pipes are made of polyethylene, aluminum is used for the production of the middle layer.

The name of this special pipe is derived from the special method used to produce it. Aluminum layer is twisted over the polyethylene layer (its molecule structure includes cross linked PE-Xb) and these two materials are then fixed with arc welding (Tungsten Inert Gas).

Inner and outer surfaces of TIG Pipes are formed by PE-Xb layers which are resistant to high temperatures, hygienic, , resistant to corrosion and impacts taking root of external influences, very smooth and which are preventing sedimentation, providing excellent isolation.

In addition to these, a special adhesive and method is used for fixing the inner and outer PE-Xb layers with excellent properties to the aluminum layer.

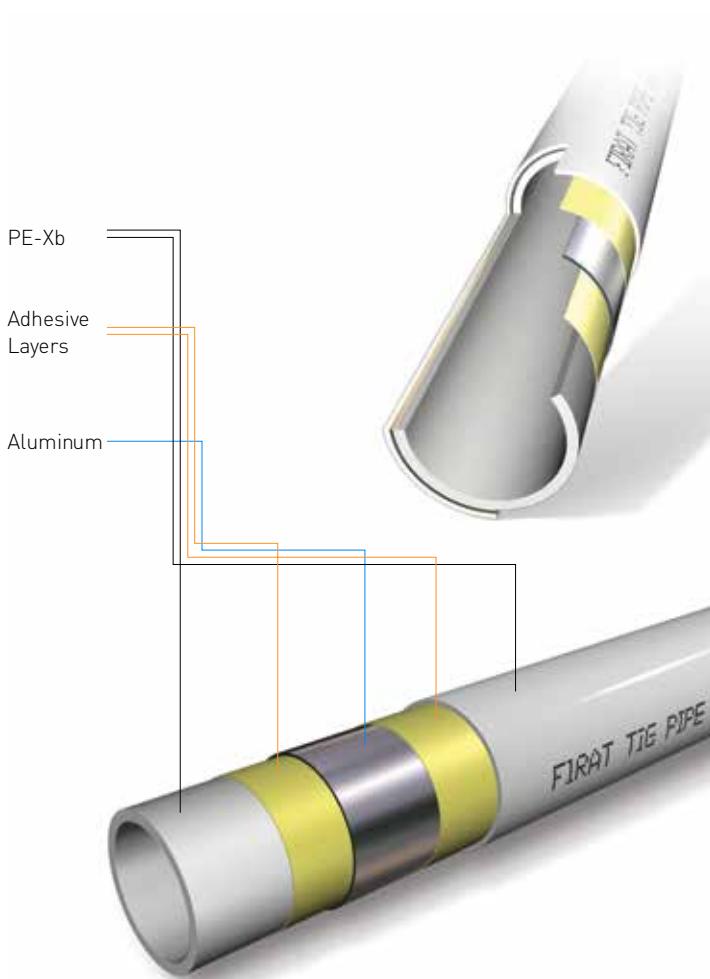

Welding Technology Used for the Aluminum Layer of Tig Pipes

The welding technique named as Tungsten Inert Gas has been considered to be a very important technological development by the plastics industry in recent years. This method includes bending the aluminum layer onto the PE-Xb inner layer and then fixing these two layers through arc butt welding. This technology surpasses the old technologies like overlapping in terms of life time and reliability.

Pex-Al-Pex Pipes (Multi Layer Tig Pipes)

PE-Xb: Polyethylene surface with high resistance.

Aluminum: Aluminum surface entirely covering the inner PE-Xb surface.

Adhesive Layers: High strength bindingsurfaces for binding aluminum and PE-Xb surfaces.

Advantages Provided by PE-Xb Layers

- The outer layer made of PE-Xb prevents corrosion on construction materials (lime, mortar etc.) and the aluminum layer of the pipe. It also provides resistance against impacts.
- The smooth surface of the PE-Xb inner layer both decreases the pressure value and also prevents sedimentation.
- Thermal conduction property of PE-Xb is excellent. Thanks to this, energy saving is possible for hot-water applications.
- The cross-linking PE-Xb forming the inner layer fulfills the human-health requirements for liquid foodstuff and fresh water applications.
- TIG Pipes produced from PE-Xb raw material are ideal for conveying acidic and alkaline fluids thanks to the properties of the raw material.

Specifications for PE-Xb

Density	0,950 gr/cm ³
Water temperature (application)	+95 °C
Softening temperature	135 °C
Thermal conductivit	0,37 kcal/m h °C
Cross-linking degree (minimum)	65 %
Elongation at break	500-600 %
Breaking strength (at 20 °C)	290-300 kg/cm ²

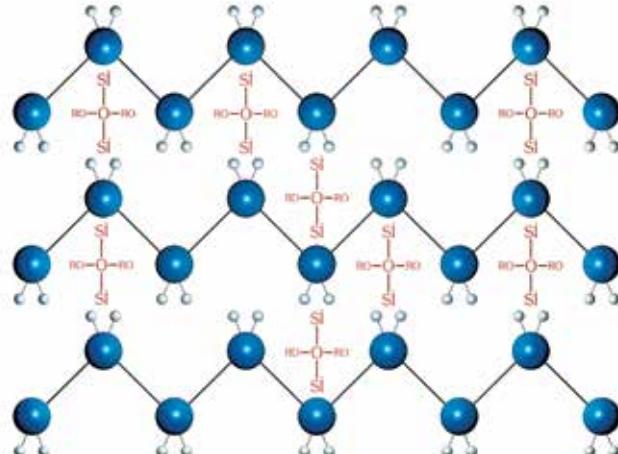

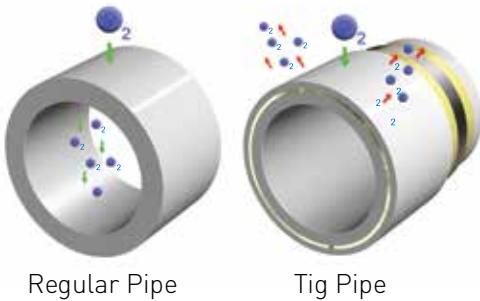

Pex-Al-Pex Pipes (Multi Layer Tig Pipes)

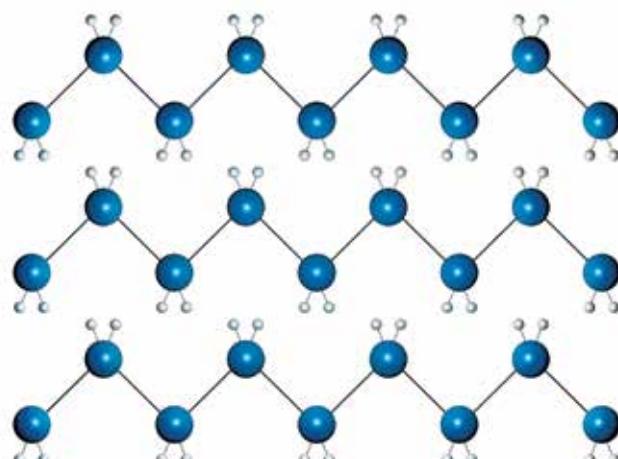

Properties of Cross-Linking Polyethylene (PE-Xb)

Currently, pipes produced from HDPE raw material are used for conveying fluids with maximum temperature of 50°C. However, even at 50°C, it is a must to exercise a pressure lowering factor. On the other hand, pipes made of cross-linking polyethylene (PE-Xb) present an excellent capacity to convey hot water with temperature values higher than 50°C. Service life problem for pipes, related to hot water conveying, is eliminated with the use of cross-linking PE-Xb.

Cross-linking process forms polymer chains between micro-molecules. This process, conducted with Silan method (PE-Xb), delivers a much longer service life for pipes.

Pert-Al-Pert Pipes (Multi Layer Pipes)

FIRAT multilayer PERT-AL-PERT pipes are used for hot and cold water applications and underground heating systems. Multilayer composite pipe is flexible, can be easily shaped by hand, and maintain its form. This is why pipes are suitable to apply different ground, pavement and wall type systems with varieties of plumbing.

FIRAT PERT-AL-PERT pipes are produced according to German Standard SKZ HR 3.12 (Application Class 4)

Max Operating Temperature: **95°C**

Max Operating Pressure: **10 bar**

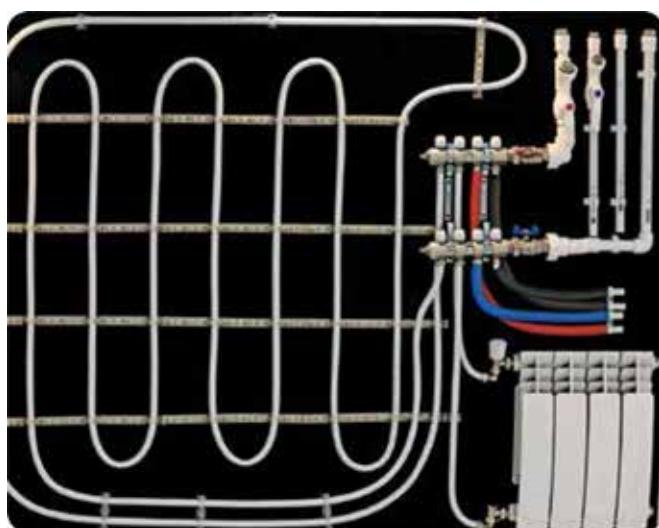

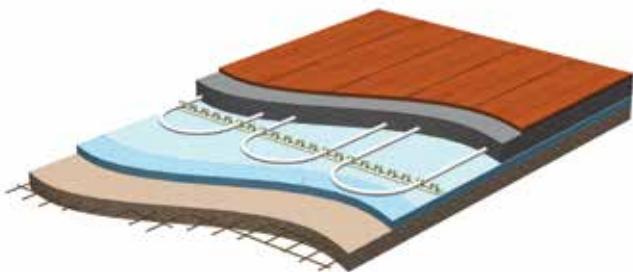

Min Bending Radius: **5 x Outer Diameter**

Thermal Conductivity: **0,45 W/m K**

Thermal Expansion Coefficient: **0,026 mm/m K**

PERT-AL-PERT (Five Layered Composite Pipes)

- Long Service Life
- Low thermal conductivity
- High temperature and corrosion resistance
- Hygienic and Environmental Friendly

Inner Layer: Smooth and Clear PERT Surface provides great water flow and have all properties and advantages the of PERT.

Adhesive Layer: This special and highly adhesion layer keeps layers together as one in tough conditions.

Aluminum Layer: Integrated to inner layer with adhesive and maintains maximum oxygen impermeability to protect metal components from corrosion.

Adhesive Layer: This special and highly adhesion layer keeps layers together as one even in tough conditions.

Outer Layer: Have all the properties and advantages of PE-RT ro metarial Protects Aluminum core from outside effects and helps to stand against high temperatures.

PERT-Al-PERT Pipe has special welding technique named as Tungsten Inert Gas this has been considered to be a very important technological development by the plastics industry in recent years. This method includes bending the aluminum layer onto the PE-RT inner layer and then fixing these two layers through arc butt welding.

Pert-Al-Pert Pipes (Multi Layer Pipes)

Raw Material

PE-RT: Polyethylene of Raised Temperature Resistance

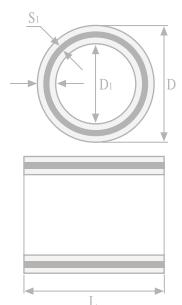

PE-RT has a higher Long-Term Hydrostatic strength (LTHS) and Mechanical properties in hot water applications.

Press Fittings (For Multilayer Pipes)

Tig Pipe Press Fittings are suitable for:

- hot and cold water supply systems,
- heating systems,
- industrial applications

Press Fittings can be used with Pex-Al-Pex and Pert-Al-Pert pipes.

1. Products should be stored in its original packaging which is protected against dust which may come from outside during storage, transportation and installation. Press fitting should not be kept in dusty and corrosive environment.
2. Connection system; The fitting consist of a Plastic Ring, Sleeve and O-Ring. Fittings with missing elements should not be installed.
3. Fitting must be removed from the package when installed and installing should done by competent personnel.
4. Fittings must be used in water systems, not in flammable and combustible gas systems.
5. External factors (dirt, sand, burrs, etc.) in the installation should be cleaned before installation
6. The surface of the pipe to be installed must be cut perpendicularly axis and not to be crushed and smashed, it must be free from particuls, the pipe must be calibrated with the special tool calibrator.
7. Special should be paid that the fittings and the connecting parts are coaxial. The same axial and non-bracing installation should not be aplicated.
8. The pipe to be installed must be clearly seen through the observation holes on the Press Metal Ring, otherwise the installing and pressing process should not be done.
9. Press fitting pressing process must be performed using the diameter and jaw types specified on the Press Metal Ring (TH-H-U).
10. Only suitable teflon tape should be used on the threads of the fittings.
11. Installation Process must only be done with the appropriate size key from the key mouth parts during the installation.
12. Fittings should not be used with the pipe connections without ensure adequate flow and proper control.
13. Non-abrasive materials must be used on the surface of the fittings during cleaning and painting operations.

FIRATPEX Pipes and Fittings

Polyethylene based FIRATPEX Pipes System as the smart product of the plastic technology is the single pipe system which can be used in hot-cold water installations, underfloor heating, portable and clean water systems.

Thanks to their flexible structure, FIRATPEX Pipes can be used comfortably in different forms in different floor, furnishing and wall types and as sheathed in radiator systems which are so-called as portable installation as well as any kind of sanitary installation systems.

FIRATPEX Pipe Systems is the best installation solution for heating different buildings such as business complexes, residents, sports halls, schools, laboratories, chapels, theatres etc.

Due to its nature, polyethylene cannot resist against hot fluids, however, if their molecular chain structure is transformed into crosslink-PE-Xb structure, they become durable against very high temperatures. FIRATPEX Pipes based on cross-linked polyethylene can operate in all temperatures between -100 °C and +110 °C without deterioration in its structural properties.

Sheathed Firatpex Pipes

Sheathed Firatpex Pipes are generally used in radiator systems, also called as portable installation and cold-hot water installations and it is applied by placing a spiral sheath inside the PEX pipe.

Advantages of Sheath (Protective Spiral Pipe)

1. Sheath prevents abrasion of PEX Pipes.
2. Sheath Prevents the impacts that may be directed onto PEX pipes.
3. Sheath ensures easy replacement of pipes without removing flooring if PEX pipes are damaged.
4. Sheath maintains heat insulation and prevents water losing its heat by forming an air gap between PEX pipe and screed concrete.

Service Life of PE-Xb Pipes

Guaranteed service life of Firatpex pipes is 50 years under 12.5 bar pressure at 20 °C. Moreover, Firatpex pipes can achieve 50 years of service life under 7.1 bars at 70 °C.

PE-Xb Pipe Diameter Values

Rated Diameter External Diameter (mm)	Wall Thickness (mm)
14	2.0
16	2.0
17	2.0
18	2.0
20	2.3
25	2.8
32	3.6

FIRATPEX Pipes and Fittings

Crosslink

FIRATPEX Pipes are produced with extrusion method. Later formed into a coil, FIRATPEX Pipes are placed in steam tanks and cured for approx 4 hours. As a result, polymer chains are linked with side chains and turns into one molecule and transformation into cross linked structure is completed.

Crosslink Types

There are different types of pex pipe systems as PEX-a Peroxide, PEX-b Silane and PEX-c Irradiation (Difference between types depends on production method and crosslink ratios stipulated by TS 10762-2 EN ISO 15875-2 Standard).

PE-X_a is also known as peroxidised method. Before extrusion, peroxide is mixed with PE rawmaterial. Crosslink is maintained during production. It is the oldest method known. The crosslink degree must be 70% at least.

PE-X_b is also known as silane method. It is produced with mixing cross linkable High Density Polyethylene which is resistant against heat and pressure and a special liquid called as "silane" at specified ratio. Crosslink is facilitated with steam cure which is a special process after production. The crosslink degree must be 65% at least.

PE-X_c is known as irradiation method. It is produced from High Density Polyethylene rawmaterial having high molecular weight. Cross link is maintained with irradiation process after production. The crosslink degree must be 60% at least.

FIRATPEX Pipe Systems are produced with PE-Xb method which is also known as Silane Method since high performance against temperature and flexibility features.

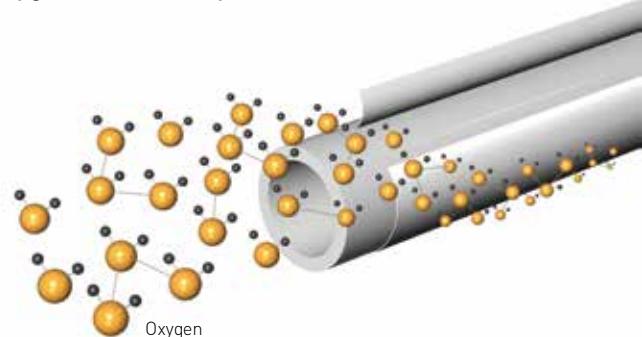

FIRATPEX Pipe Systems are produced in four different types according to application areas in line with TS 10762-2 EN ISO 15875-2 standard.

1. PEX Pipes with Oxygen Barrier.
2. Self-Sheathed PEX Pipes with Oxygen Barrier.
3. PEX Pipes without Barrier.
4. Self-Sheathed PEX Pipes without Oxygen Barrier.

FIRATPEX Pipes with Oxygen Barrier

Due to oxygen permeability feature of plastic materials, they allow the oxygen penetration into water from outside in heating systems. In such cases, oxidisation and corrosion can be seen in radiator, natural gas boiler, boiler and installation. In order to eliminate this problem, external surfaces of PEX pipes are coated with a bright layer which is insulated against oxygen transmission between inside and outside of pipe with a special method during production, so that their tightness against oxygen is maintained. Therefore, oxygen is prevented to be transmitted into water inside installation and no corrosion and oxidation can certainly be seen.

Oxygen Permeability Amount Determination: DIN 4726

IZOPEX / Pre-Insulated Multilayer Pipes

IZOPEX / Pre-Insulated Multilayer Pipes

Pipes with insulation coating consist of an inner and outer surfaces of TIG Pipes are formed by PE-Xb layers which are resistant to high temperatures, hygienic, resistant to corrosion and impacts taking root of external influences, very smooth and which are preventing sedimentation, providing excellent isolation. In addition to these, a special adhesive and method is used for fixing the inner and outer PE-Xb layers with excellent properties to the aluminum layer.

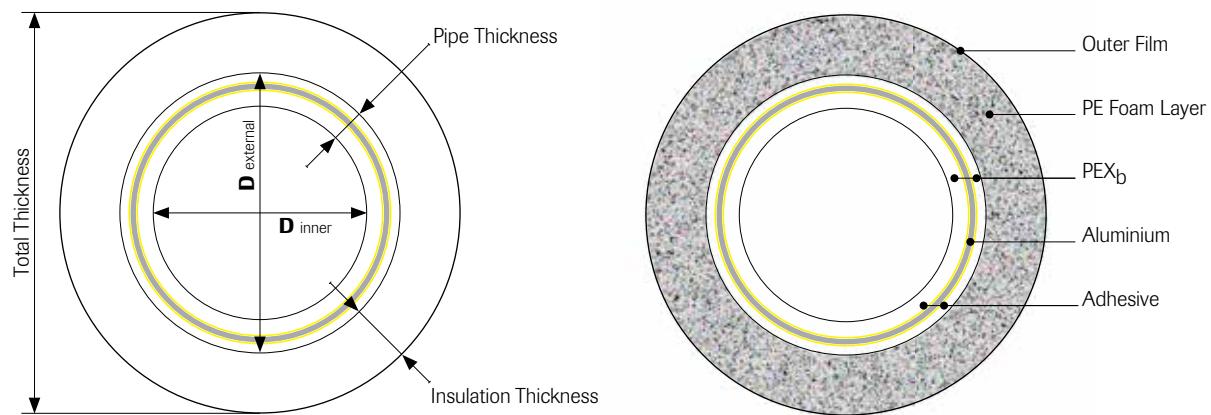

The insulation coating, made with polyethylene foam, enhances the system energy efficiency and further reduces the noise transmission

The insulation section consists of a polyethylene foam layer protected by a special outer film - red or blue for heating and cooling systems.

Metal Systems

Production

Metal Fittings are subjected to various processes until they become a finished product from brass rawmaterial. These processes are lined up as follows;

- Supplied in form of bars, brass rawmaterial is cut to required dimensions and weights using automatic saws and prepared for forging process.
- Heated in high temperature ovens, brass bars are forged with automatic presses and turned into semi-finished product.
- Pressed product is sandblasted and processed in robotic full-automatic machinery and prepared for nickel plating.
- Nickel plated products, accessories and sealing elements are assembled in fully automatic machinery
- All Metal Fittings are subjected to 100% tightness test upon assembly.
- Metal Fittings which pass the tightness test are packaged automatically and made ready for shipping.

Brass

Firat uses special CU 617N (MS 58) Brass as rawmaterial for the production of Metal Fittings. Brass is preferred in production of metal fittings due to its ease of process, extended usage life, high resistance to abrasion and corrosion. Supplied in form of bars, brass rawmaterial is manufactured as per EN 12164 and EN12165 standards.

EPDM O-Ring

Perfect functioning of Firat Metal Fittings can only be ensured by using correct O-Ring in the system. Ethylene Propylene Diene Monomer (EPDM) is used as the most suitable rawmaterial among synthetic rubbers for O-rings used with Firat Metal Fittings. The only gasket which is resistant to air-water oxidation, ozone cracking is the only EPDM rubber product which has permanent deformation values required for tightness between temperatures -40°C and +130°C.

Nickel Plating

Firat Metal Fittings made of MS 58 Brass are available in nickel plating. With nickel plating, fittings have a shining and beautiful appearance and their outer surface corrosion resistance increases and it provides a longer useful life.

Metal Systems

Radiator Valves

Firat metal ball valves are fittings used by plumbers while carrying out opening-closing etc. checks and tests by installing them to the input parts of the collectors employed in FIRAT PEX floor heating systems, FIRAT PEX mobile heating systems, FIRAT PEX water supply systems and similar systems. Housing, internal mechanism and connections of Firat metal ball valves are made of MS 58 brass material and EPDM O-Ring and PTFE (Teflon) are used for ensuring tightness.

Firat ball valves are subjected to the following tests as per TSEK* quality criteria.

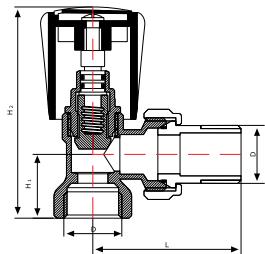

- External Leakage Test in Closed Position
- Internal Leakage Test in Open and Closed Position
- Pressure Test
- Thickness of Coating Test (It is applied on the material in addition to standard tests.)

Installation and Usage Information for Ball Valves

- The valve is designed for heating systems. It shall not be used for flammable-burning gas systems.
- System pressure shall not exceed 25 bars and operating temperature shall not exceed 105°C.
- For mini ball valves system pressure shall not exceed 16 bars.
- Installation of the valve shall be carried out by a qualified plumber.
- All foreign substances (dirt, sand etc.) in the system shall be cleaned before installation.
- The valve shall only be installed with original fittings.
- Installation direction shall be determined according to the arrow sign on the valve housing which show the flow direction.
- Threaded parts of the fittings shall be covered with suitable sealing materials (teflon tape).
- The valve shall be tightened from the corresponding section using a suitable wrench during installation. The valve shall not be tightened by using the housing.
- Adjustment knob shall not be forcibly rotated past the end and the valve shall be used in fully open or fully closed positions.
- Abrasive chemicals shall not be used to clean the valve.
- System shall be protected against risk of freezing.
- It shall be protected against external impacts during storage, shipping, installation and operation.
- Useful life established and announced by Ministry is 5 years.

PPRC Pipes and Fittings

PPRC Pipe

PPRC Composite Pipe

PPRC Aluminium Foiled Pipe

PPRC Pipes

Made of PP-R (Polypropylene Random Copolymer) Type 3 class raw material FIRAT PPRC Pipes and Fittings, which are manufactured pursuant to TS 9937, TSEN ISO 15874, DIN 8077, DIN 8078, DVGW W544 standards, can be employed in any kind of in building hot and cold water installations. PPRC Pipes and Fittings have a minimum lifespan of 50 years when used under suitable pressure and temperature values.

COMPOSITE Pipes

1. Since Firat fiberglass added PP-R pipes have a thermal expansion coefficient close to foiled pipes, they can be used in areas where foiled pipes are utilized.
2. Welding of Firat fiberglass added PP-R pipes are similar to normal pipes. Since they do not require trimming, they provide 30% faster application compared to foiled pipes.
3. Firat fiberglass added PP-R pipes do not cause condensation and elongation in systems where heating and cooling is used together.

Welding Specifications for PPRC Pipes

Outer Diameter (mm)	Welding Depth (mm)	Heating Period (sec)*	Welding Period (mm)	Cooling Period (minute)

Do's and Don'ts in PPRC, PPRC Aluminium Foiled and Composite Pipes and Fittings

- At the end of foil stripping process, no foil particles should remain at welding distance.
- Hot air should be used in joints requiring bending process up to 30°, and 45° joints should be used in joint above 30° degrees.
- In metal fittings applications, excessive tightening should be avoided and teflon tape should be used instead of cannabis.
- Pipes should be cut by a sharp pipe clippers perpendicular to pipe axis.
- No welding should be performed on dirty pipes and fittings; pipes and fittings deformed and cracked at cutting points should not be used.
- Pipes should be protected against all kinds of blow and strike impacts.
- Conical toothed parts should not be employed at joints.
- Installation should be protected against the risk of freezing. If installation shall not be used after testing process, water inside the installation must absolutely be discharged.
- If teflons on threaders are run out or out of order, welding should not be employed (Teflon lifespan is around 2-3 household applications).
- Welding rest period should be obeyed, pipes and fittings should not be rotated during melting process.
- Measures should be taken against steam pressure accumulation in gas heater installations.
- Pipes and fittings should not be exposed to direct sunlight for long periods.
- Raw material PP-R does not contain strength stabilizer against UV rays. Maximum period of storage in an environment exposed to sunlight is six months.
- After the installation is completed, pipes and fittings should be isolated against UV rays and freezing at the sections remained outside the building.

Dublex Waste Water Pipes and Fittings

Firat Dublex PVC waste water pipes and fittings are used in the villas and multi-storey buildings, hospitals, schools, hotels, industrial and sport buildings etc. as they are environment-friendly and cost-effective, maintaining its physical structure up to 60°C, suitable for long-term use, allowing safe and ideal discharge of surface and subsurface waste water.

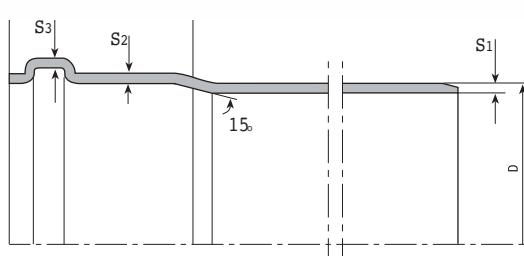

FIRAT Duplex PVC waste water pipes and fittings are manufactured in the wall thicknesses of the application class BD specified as per the quality standards TS 275-1 EN 1329-1. Thanks to their smooth internal and external surfaces, they do not allow formation of deposit and debris or growth of bacteria and smell.

Flame Retardant Non-Combustible Body Structure

Double Stripe Industrial Design

Leak-proof Sealing System

Manufactured from rigid PVC raw material, FIRAT Duplex PVC waste water pipes and fittings are of flame-retardant construction material class B1 as defined by the DIN 4102 and National Fire Regulations. FIRAT Duplex PVC-based waste water and fittings are, therefore, fireproof in case of possible fire cases (PP-based materials are inflammable and combustible), preventing spread of fire between the floors. For this reason, they are especially recommended for the multi-storey buildings.

With a wide range of alternatives in sizes, e.g., 50 - 315 mm diameter and 150 - 6000 mm length, FIRAT Dublex waste water pipes and fittings satisfy all kinds of requirements for discharge of waste water discharge. Dublex PVC waste water fittings never allow leakage due to the sealing bearings which are single-cheek, spiked and fully compatible. As they are easy to install and replace, the discharge system is installed quickly and does not require laborious operations such as cutting, bending and adhering.

Physical Specifications of Dublex Pipes

Outer Diameter (mm)	S1 (mm)	S2 (mm)	S3 (mm)	LB	Weight (kg/m)

Dublex Waste Water Pipes and Fittings

General Features

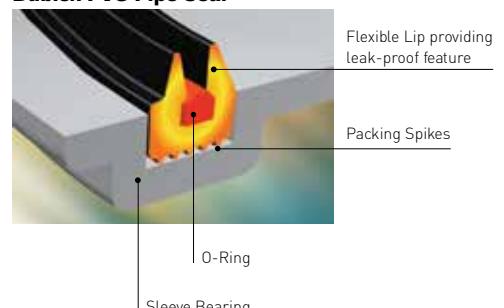

- PVC-U Pipes and fittings are used for waste water discharge in buildings.
- They are manufactured in diameters between Ø 50-315 mm as defined in TS 275-1 EN 1329-1 standard and in various lengths from 15 cm to 6 m with seals.
- The most important feature of PVC-U Pipes and fittings is their non-combustibility. With this feature, spread of a fire between floors in the building is prevented.
- FIRAT Duplex PVC-U Pipes are manufactured as BD class (with thick wall) as defined in TS 275-1 EN 1329-1 standard.
- BD application field code defines applications, including surface and under plaster mounted systems, until building sewage system connection
- PVC-U Pipes and fittings preserve their physical structure under continuous operating temperature up to 60°C.
- Cornered seal groove and special seal ensures 100% leak-proof performance in leakage test (0.5 bar 15 min).

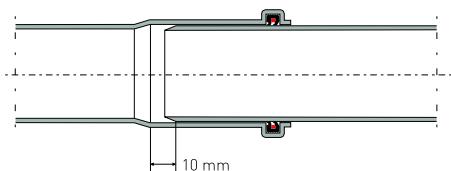

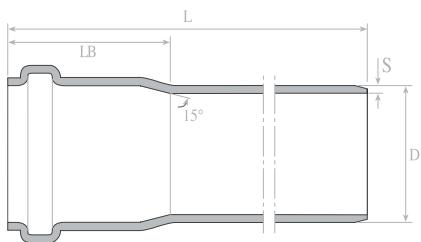

Collar interval in the installation of PVC Dublex Pipes and Fittings should be 1 m.

Gediz Pipes

General features

- Gediz Pipes are produced with diameters from Ø 50-200 mm and in various lengths from 50 cm to 6 m with seals.
- The most important feature of Gediz Pipes is non flammability. This feature prevents spread fires between floors in the building.
- Gediz Pipes preserve their physical structure under continuous working temperature up to 60°C.
- Cornered seal groove and special seal ensures 100% leak-proof performance in leakage test (0.5 bar 15 min).

New Residence Silent Power Pipes and Fittings

General Definition

Fluids passing through the pipe at different flow velocities cause vibrations while hitting the pipe walls and obstacles in the pipe and make sounds that cause disturbances in living spaces.

Modern developments in the construction sector have accelerated housing delivery times. Construction companies needed quieter piping to reduce the additional labour costs and time costs for installation of insulation.

Silent Pipe Usage Areas

Due to its characteristics of being ecological, economic and soundproof Residence Pipe and Fittings is a preferable choice to be used in villas and multi-storey residences, hospitals, schools, hotels and industrial or sportive structures, etc. Silent pipes ensure for the sewage from the foundations and interior structures of buildings to be drained in an ideal and safe way without any leakage for long terms use (50 years).

Wall Thickness (mm)	3.6	3.6	4.2	4.2	5.0

New Residence Silent Power Pipes and Fittings

Material Specifications

Residence Pipes And Fittings are produced in 3 layers with a mixture of U-PVC and vinyl-copolymer (FRvinylflex) raw materials.

The inner Layer: is made of U-PVC with smooth inner surface.

The middle Layer: FRvinylflex® is a mineral-based additive developed in Fırat R&D laboratories which provides Residence pipes and fittings with soundproof features.

The outer Layer: It is made of U-PVC which protects the pipe against external impacts.

Seal

The seals used in Residence Pipes and Fittings are made from EPDM paste and thanks to their unidirectional and special outside shape they provide 100% impermeability. Produced according to TS EN 681-1 standard.

Look

Residence Pipe and Fittings are produced in a grey colour.

Feathered structure with increased impact resistance have been added to the muff sections.

New Residence Silent Power Pipes and Fittings

Fraunhofer Institut Für Bauphysik

According to the test report "Determination of Acoustic Performance in Laboratory Conditions of Waste Water Installation Systems" by Fraunhofer IBP Institute of Building Physics, the sound value of Residence Pipe and Fittings was tested at 17 dB.

Residence Pipe Systems are soundproof.

According to the results of the sound level measurement test done at the Fraunhofer Institut Bauphysik (Germany) Residence Pipes and Fittings meet all national and international standard requirements.

Standards And Test Reports For Residence Pipe And Fittings

- Meets the mechanical and physical requirements of BD class of the TS EN 1329-1 standard.

BD Implementation class covers in-building and surface application areas, in-building under the surface application areas, and application areas up to the sewer connection of the building.

- Residence Pipes and Fittings are of the non-flammable class within the scope of the "Regulation on Protection of Buildings from Fire" as stated in the 2007/12937 decision of the Ministry of Public Works and Settlement.

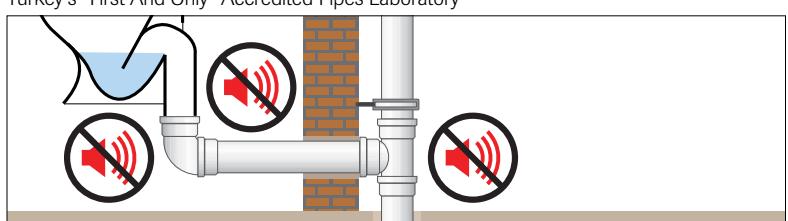

- As a result of the fire response performance test carried out at UL (Underwriters Laboratories), an independent US-based product safety certification agency, Residence Pipes and Fittings are categorized as V-0 NON-COMBUSTIBILITY class.

- TSE TEST AND CALIBRATION CENTRE EXAMINATION AND TEST REPORT Fire response classification of Residence Pipe and Fittings was found as B S2 D0 according to TS EN 13501-1 + A1: 2013-04 Fire Response Classification of Construction Products And Building Elements. Fire Class B, Smoke Formation S2, Flaming Droplets D0.

Rain Gutters And Fittings

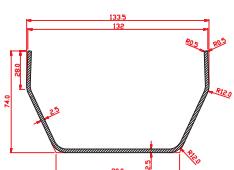

Designed and manufactured in two different types as Decorative and Corner Shaped (150) pursuant to TS EN 607 standard, Fırat Gutters and Fittings offer time, labor and cost advantages to the users with their standardized technical features, excellent gutter profiles, quick and simple installation and guaranteed function.

Manufactured with advanced technology upon determining precipitation quantity and the required section diameters accordingly, with the tests during design phase, Fırat Gutters and Fittings constitute a rain water discharge system which operates well, is highly functional and has an aesthetic appearance.

Advantages of PVC Gutters and Fittings

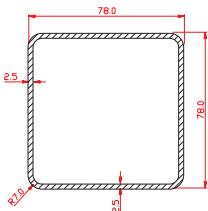

- Easy, quick, problem-free and safe installation with perfectly compatible fittings.
- Ensures 100% leak-proof with specially designed seals.
- Has dimensional functionality and a rich variety.
- It is resistant to corrosion, fading and is stainless.
- Functions perfectly even under hot and cold weather conditions.
- Produced using the latest technology.
- Suitable for all facade constructions and can be utilized for any roof and gutter types.
- It has a system structure which enables problem-free intervention every time.
- It is highly efficient with its economical and maintenance-free lifespan.
- They have high rain water conveying capacity.
- It can convey rain water even on very slight slopes.

HDPE Pipes and LDPE Pipes

Polyethylene Rawmaterial

Advancements in the technology ensured that important advancements were also realized in plastic raw material production. Low density polyethylene (PE 32-LDPE) which was developed in 1950's were firstly used for potable water piping. Later, with the development of PE 63 raw material, application in systems which do not require high pressure was realized successfully. However, it was only possible to use PE 63 in natural gas systems which require low pressure (maximum 4 bars) due to its technical properties. PE manufacturers launched PE 80 rawmaterial as 2nd generation after PE 63. Thus, it was possible to use PE 80 rawmaterial in potable water and natural gas networks with high performance. 3rd generation PE 100 rawmaterial which was developed in the beginning of 1990s offered higher performance and an economical solution for potable water, utility water and natural gas networks.

FIRAT PLASTİK A.Ş. manufactures PE 100 pipes between diameters of Ø 20 - Ø 1600 mm, PE 80 natural gas pipes between diameters of Ø 20 - Ø 630 mm and PE 40 MDPE potable water pipes between diameters of Ø 20 - Ø 110 mm.

PE pipes are produced in coils up to Ø 125 mm, diameters equal to Ø 125 mm and higher are produced in 12 m length, additionally, custom productions can be carried out.

Advantages of Polyethylene Piping

- They have high flexibility features. Thus, they ensure ease of installation. Elongation at break is minimum 350%.
- They are not affected from underground movements, they do not break.
- They have high impact resistance and rapid crack propagation resistance.
- Since they have low interior surface roughness, they ensure significant advantages while selecting diameter during project design.
- They are suitable for installing on sea bottom, they are not affected from sea water and sea movements.
- They do not have installation wastage thanks to the joining method.
- Black colored pipes are resistant to UV rays.
- They are not affected from harmful substances which are contained in the structure of soil that cause abrasive effects. Therefore, cathode protection is not required.
- They are resistant to chemical substances.
- They do not change odor and taste of water, therefore, fit for health.
- It is not possible for plant and tree roots to penetrate inside the pipes.

Hoses Systems

Do's and Don'ts in hoses

- Hoses which are in coil shape, should be stored horizontally and properly in order to avoid deformity.
- The temperature should be between 10-30 °C in storage area.
- Hoses that are stored in low temperature areas should be allowed to reach normal environmental temperature before usage. (Low temperature makes hoses stiff).
- Hoses should not be used at higher working temperatures and working pressures than those specified at technical catalogue.
- Hoses should be protected against stroke.

Drainage Pipes

Conforming to TS 9128 and DIN 1187 standards, Fırat PVC-U Drainage Pipes are available in diameters of 80, 110, 125, 160 and 200 mm. Width of water input openings of PVC-U Drainage Pipes, which are manufactured from PVC-U raw material, falls within medium size (1.2 ± 0.2 mm) as specified by TS 9128 standard. Used safely under heavy chemical conditions, Fırat PVC-U Drainage Pipes have a minimum lifespan of 50 years.

Areas of Use

- Protection of buildings and structures which have water in the foundation
- For highway banquet drainages
- Infrastructure of sports arenas (grass pitch, courts, tracks)
- Improvement of muddy and sludgy areas
- Removal of unwanted waters in agriculture

Physical Specifications of Drainage PVC-U Pipes

Diameter (mm)	Outer Diameter* (mm/minimum)	Internal Diameter (mm)	Minimum Coil Reeling Diameter (mm)
80	80 ± 0.5	71.5	600
