INDOOR STATION

FT3000: Image and speech on smartphone over WIFI, 3G, 4G

This module whisks sound and pictures from any Fasttel Wizard door entry phone to an iPhone, iPad, Android devices and Pc's. All of this is accomplished by one unrivalled application that also allows you to:

- Integrate an unlimited number of entry phones
- View up to 10 IP cameras
- Activate up to 8 relays
- View the status of 8 inputs

If available, WiFi is used in the standard configuration. If not, the app automatically switches to a 3G/4G connection. That means you have world-wide control over your visitors. You can see them and speak to them, access several cameras and activate multiple doors. You won't find greater flexibility anywhere on the market!

WITH OR WITHOUT A TELEPHONE EXCHANGE

The module can be used with or without a telephone exchange.

Without a telephone exchange, only SIP devices, iPhones, iPads and PCs can receive calls from the outdoor station. An analogue or VOIP telephone line can be connected as back up so that the call can be transferred (using the traditional method) to a mobile phone or to another number in case of lack of mobile data.

Coupled with a telephone exchange, our solution is even more unique. In that case, the call is simultaneously transmitted to the traditional telephone network as well as to the IP devices connected to the FT3000. You can then answer the call and open the door with either device.

Even installations that include third party outdoor stations are compatible with the FT3000. Although, these installations must be telephone-based.
All old Fasttel door phones can be integrated, regardless of their age.

CONFIGURATION

The entire project is configured via one web interface. Analogue and SIP intercoms, users and cameras are defined here.

The FT3000 can also be logged in as a client to the main SIP server.

Integration of any SIP phone and/or home automation display.

With the app, multiple cameras can be viewed simultaneously as well as the status (open/closed) of multiple gates.
