General

Housing

Powerduct busway is constructed with **extruded** aluminium and is designed with cooling fin on both top and bottom.

Benefits of such design are as follows:

- Super Compact & Light Weight
- Low Impedance
- Greater heat dissipation
- Better housing as Ground medium
- Dust free
- Corrosion free
- Low Installation Cost
- UV resistance

No doubt, this construction has been tested and has achieved the highest 60-cycle short circuit withstand ratings under the IEC and BSEN publication 61439-6 : 2012 approved by third party certification.

The enclosure has also been tested for ingress protection and achieved the highest **IP68** for **standard feeder** and **IP55** for **plug-in section** (ref. Table 8.2).

Hence, this has proved Powerduct housing construction has mechanically strength and it's reliability to protect the busbar conductor.

Standard

All the Powerduct busway product is designed and manufactured in compliance of the following standards:

- IEC 60529
- IEC 61439-6
- UL 857
- CSA 857
- CSA C22.9 NO. 27-94
- NEMA BUI
- JIS 8364

Plug in outlet

Powerduct plug in outlets being designed to meet IEC 60529 and IEC 61439-6 and BS EN 60529 requirement whereby the opening safety rated for finger safety to IP2X.

Hinged dead designed at the front of each plug in outlet to protect the contact surfaces from rust, dirt and moisture. Pad lock designed on the outlet to lock the outlet for safety purpose. Gasket is used in IP55.

Plug In unit

Available in both moulded case circuit breaker and fusible type;
Powerduct Plug In features the following:

- **Interlocking door** during in 'ON' position to prevent the door from opening for safety purpose
- **Mechanically interlocking** with busway housing during 'ON' position to prevent being take off during energizing.
- The plug-in unit connection on **earth designed to engage first before phase connections** when installing plug-in unit for the safety purpose.
- All Plug In units have internationally recognized symbols indicating the "ON/OFF" position.

Thermal Indicator (optional):

Most of the busway manufacturer will have inspection covers to permit inspection of the joint periodically. However, Powerduct newly designed so call thermal indicator will provide a more convenient for continual visual inspection whereby the thermal indicator will show a sign when the joint is overheating. This benefit from convenience visual inspection without opening the cover and save time from labor inspection.

Before

After

Insulation

The **130°C Class B insulation** is the primary insulation in all conductors. Optional Mylar and epoxy insulation (Hybrid) 155°C Class F and 180°C Class H is available upon customer's request.

The innovated coating process provides high quality and uniform epoxy insulation. This epoxy is nonhygroscopic, self-extinguishing and bonded directly to the bus bar thus eliminating any air gap between the insulation and bus bars.

Advantages of using epoxy insulation are as follows:

- Able to withstand glitch and spikes in electrical system
- Halogen free
- Resistant against water and chemical
- High thermal conductivity
- High mechanical strength against impact and capable with standing heat shock
- Cater for expansion and contraction during peak and off-peak hours
- Long life compare to PVC and Mylar
- Impervious to acids, alkalis, acetones, mechanical oils and lubricants

Joint Stack

Powerduct Joint Stack (bridge type) features a single/ multiple bolt design with the double headed bolt, therefore improving the ease and the cost of the installation.

By using this newly designed joint stack, you will definitely reduce arrangement for installation works (on-site time as well as cost saving).

The use of the Belleville spring washers on the bolt ensures the original contact pressure is maintained giving a more secure and reliable joint.

Powerduct Bridge type joint Stack features performs;

- Twin headed Bolts and will shear off when torque exceeds 50lb/ft.
- Single Bolt joint system with the material composition of chrome high tensile steel.
- Ease of removal and installation without removing entire busway section.
- Maintenance Free.

Bus bars

All bus bars copper are manufactured from high electrical grade high conductivity electrolytic coppers which comply with international standard- BS1433/1432. Aluminium bus bars also available.

The copper composition of the bus bar are of 99.9% or conductivity in excess of 99% IACS. The aluminium bus bar are of conductivity in excess of 60% IACS. All the copper and aluminium bus bars are **electroplated** with **tin** on all contact surfaces. Optional **silver plating** is also available. This will improve conductivity more effectively.

All Busway are constructed in sandwich type which means no air gap shall exist between bus bars except at the joint. This can obtain **lower impedance** and **better heat dissipation**. Lower impedance means **lower voltage drop**.

The entire conductor also being insulated with epoxy powder (Hybrid Powder) coated which giving 100% water, rust and chemical resistance. Optional specification can be designed and fabricated to customer's request.
Bus bars are available in various configurations: Refer to next page picture.

1. 3P3W + Integral Ground
2. 3P3W + 50% Internal Ground
3. 3P3W + 100% Neutral + Integral Ground
4. 3P3W + 100% Neutral + 50% Internal Ground
5. 3P3W + 100% Neutral + 100% Internal Ground
6. 3P3W + 200% Neutral + Integral Ground
7. 3P3W + 200% Neutral + 50% Internal Ground
8. 3P3W + 100% Internal Ground

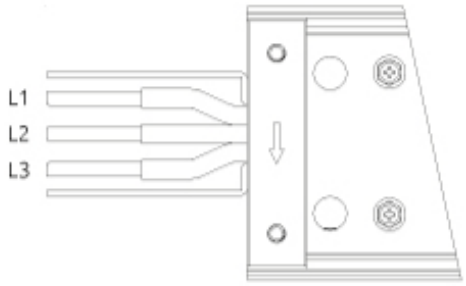
True 200% Neutral Construction

Harmonics occur generated by nonlinear load devices such as electronic ballast lightning, computers, printers, copier machines & etc. The harmonic current generated in neutral conductor can be 173% of phase current. This abnormal high neutral current results in overheating the neutral conductor and leads to deterioration of equipment performance and its life cycle.

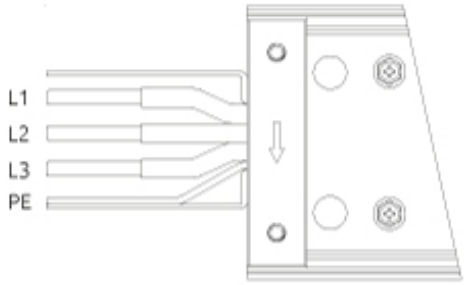
Therefore, we provide two separate 100% neutral bus bars within the same busway housing. This true 200% neutral is doubling the size of phase bus bars to prevent overheating caused by harmonics.

Bus bar Configurations

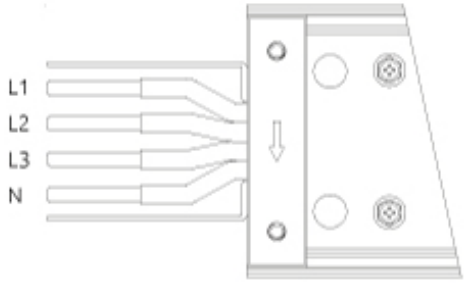
1. 3P3W + Integral Ground



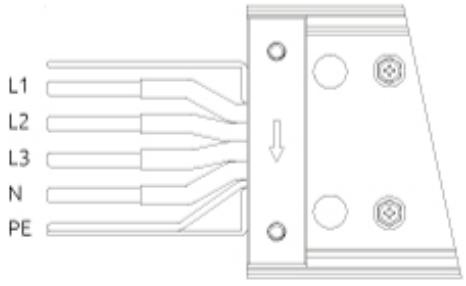
2. 3P3W + 50% Internal Ground



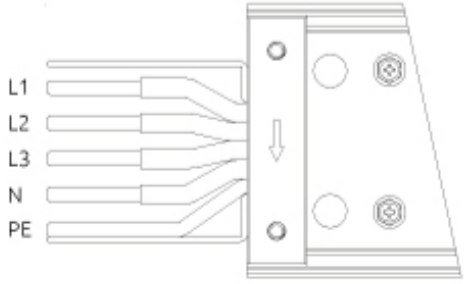
3. 3P3W + 100% Neutral + Integral Ground



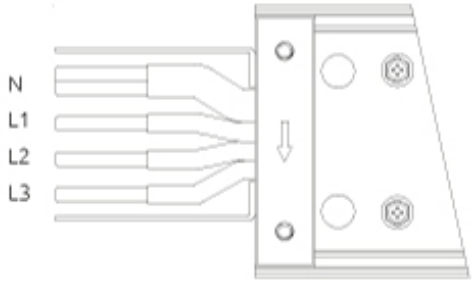
4. 3P3W + 100% Neutral + 50% Internal Ground



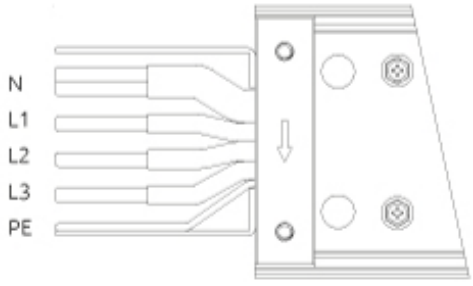
5. 3P3W + 100% Neutral + 100% Internal Ground



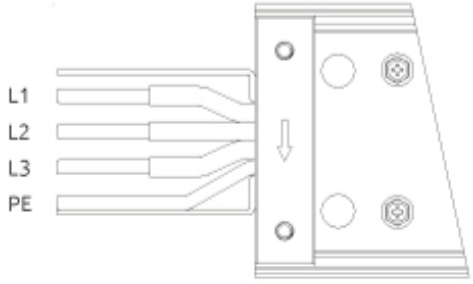
6. 3P3W + 200% Neutral + Integral Ground



7. 3P3W + 200% Neutral + 50% Internal Ground



8. 3P3W + 100% Internal Ground



Ground Resistance

Powerduct Busway provides two options of ground capacity:

- Integral aluminium housing ground (standard)
- Copper internal ground

The Powerduct aluminium housing provides extremely high ground capacity. The Table 5.1 showing the conductivity and current carrying capacity offered by the housing is at least 2 times greater than the active copper ground bar (sized 50% of the phase bar)

Powerduct busway-Ground Capacity Table 5.1

Energy Optimization

Powerduct busway system enable you to optimize the energy usage and reduce unnecessary energy wastage which is a hidden cost. Better heat dissipation will provide cooler busway energizing. At the same time, the busway has lower impedance and lower voltage drop if compared to the other competitors' busway.

These features also include extremely low reactance due to non-magnetic housing and totally intimate contact of bus bars and housing. Please refer to the Table 6.1 below for your further voltage drop information.

Table 6.1 Voltage Drop Line to Line (50 & 60Hz)

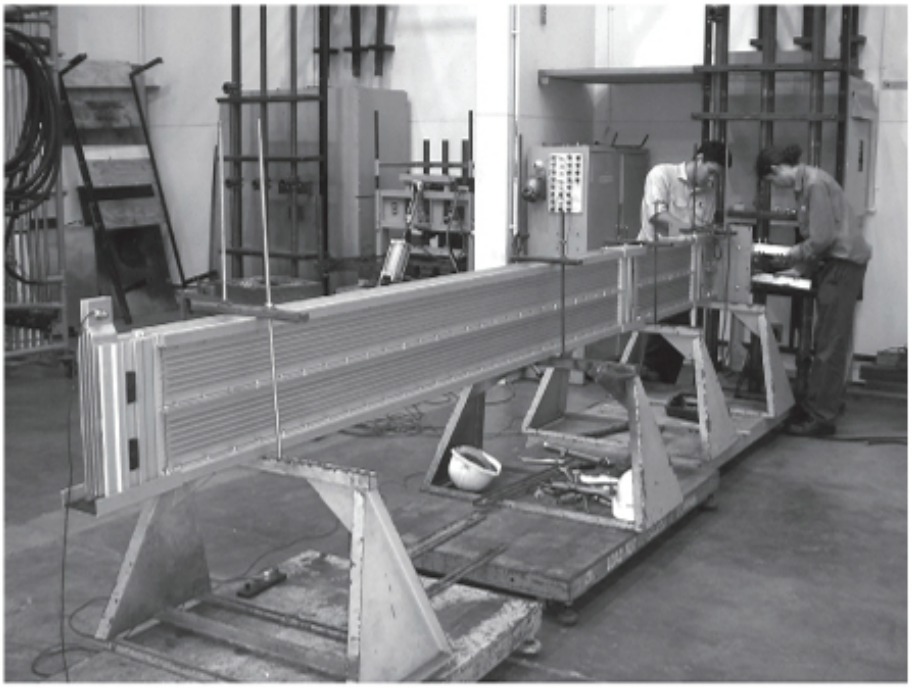
Note: Current density (amps/sq.in) rated busway available. Consult Factory Voltage Drop Formula

1. Plug-in distributed loads application, divide voltage drop values by 2
2. To determine voltage drop line to neutral, multiply values from table by 0.577.
3. Actual voltage drop for different length and at loading less than full rated current can be calculated by using the formula : Vd = Vd (table) X Actual load/Rated load x Actual length (m)/100 m
4. For 400Hz, Multiply reactance by 3.75 and multiply resistance by1.4
5. Calculate new voltage drop : Vd = Amp loads x √3 x (Rcos ø + Xsi n ø) per 100m, where cos ø = Power Factor

Design & Testing

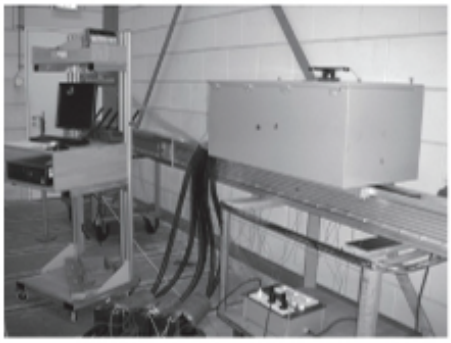
Short Circuit Protection and Capacity

Powerduct structure is designed to provide a very good short circuit protection. The short circuit has been certified by DEKRA (formerly known as KEMA) in accordance with IEC and BSEN Publication 61439-6.



Temperature Rise

Powerduct busway is capable of carrying its full rated current continuously in ambient condition of 95% relative humidity and maximum temperature of 50˚C without exceeding 55˚C temperature rise.



Thermal cycling test

Powerduct tested to ambient 50°C test

Extract from KEMA Newsletter:

Busduct beats the heat in 50 °C test

KEMA

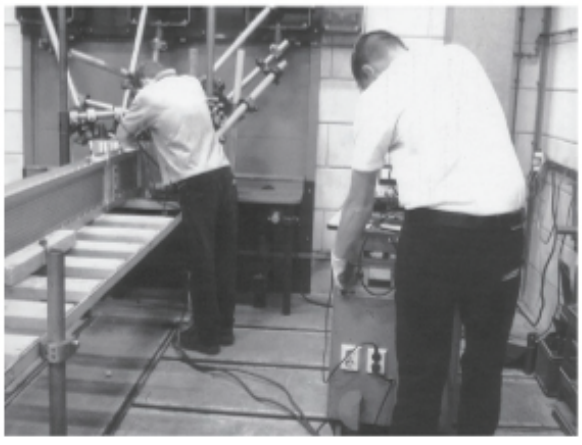
High-temperature test opens up new markets for Power Plug Busduct

Tested to IEC61439-2

When many manufacturers of electrical gear in the Middle East are pushing the envelope in testing to make sure their products can withstand the extreme temperatures in the region, thanks to the KEMA high-temperature test, the Malaysian company Power Plug Busduct sdn bhd, whose products had already undergone KEMA type testing according to the international standard, can be confident that their power ducts will provide unwavering performance at 50 °C.

High Temperature requirements

KEMA's Henk Kormelink says, "A bus duct tested according to the standard complies to a mean ambient air temperature of less then or equal to 35 °C (IEC 60439-2 international standard). However, day time temperatures in the Middle East often exceed 50 °C. It was particularly important for this client to have their product tested at the most extreme temperatures, because many of their products carry high-voltage cables that are placed in uncooled areas of buildings. These ducts must continue to operate safely at the very highest temperatures and customers cannot afford failures."



IP Rating

Ingress Protection Level

Water Resistance and Rust Protection : Powerduct busway system has been successfully developed into as high as IP68, whereby the busway is protected against dust and the effects of immersion in water. This fine completion system is in 100% compliance IEC standards and is approved through third party authority certification.

Table 8.1

Busway Type	DEGREE OF PROTECTION

Physical Data

Feeder Section – is available in standard length of 3050mm and with minimum 610mm. This straight length feeder is used to carry power supply directly to the machine and power station without any plug-in opening on the section. (Concentrated Load application) Refer to the Fig. 10.1

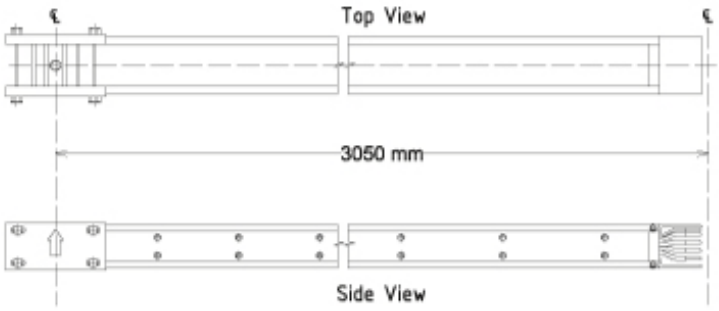

Fig 10.1 Standard feeder Section - Top and Side Views

Plug-in section – is designed to provide convenience and to allow the power to be tapped off from the LIVE busway section for a variety power usage based on the customer's requirement. It is complement with the plug-in unit. The maximum current capacity of each opening is 400A. Refer Fig.10.2

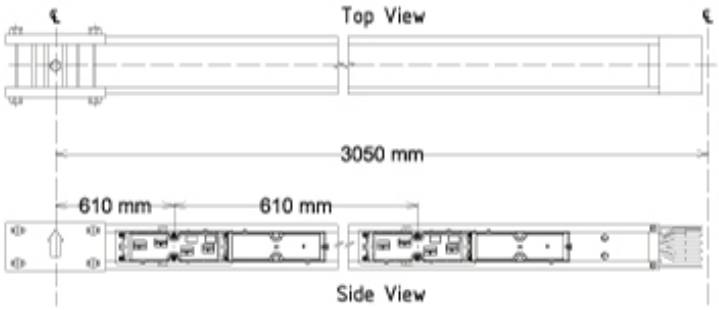

Fig 10.2 Standard Plug-in Section - Top and Side Views

Plug-In Section

Plug-In Section is available in minimum 1220mm and standard 3050mm length rating from 400A to 5000A. Custom length also is available on request.

The quantity of plug-in outlet is classified into:

Standard plug-in busway – whereas the openings outlet available in both sides to optimize the amount of plug-in units in horizontal application . Fig.11.1 (Optional 5 holes is available upon request. Please consult factory)

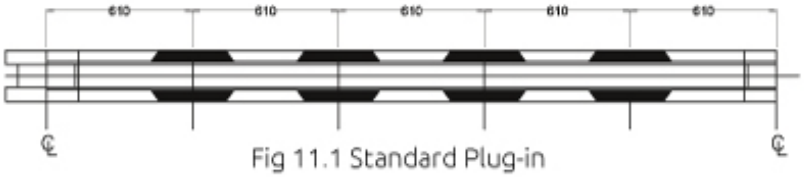

Fig 11.1 Standard Plug-in

Riser – whereas opening outlet available in one side on interval 610mm to fit the vertical runs. Fig.11.2

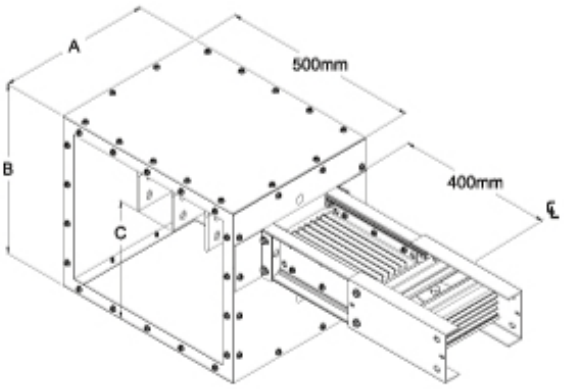

Fig. 15.2

Expansion Fitting

Powerduct Expansion Fitting is design to accommodate the busway thermal expansion in long straight runs which is over 60.8M without offsets or elbows and spring hanger are included and both ends are held fixed, or in a permanent position. In addition, it is also recommended when the busway crosses the building expansion joint.

Inside the Powerduct Expansion Fitting contains a flexible connector which provides + 50mm linear movement along the straight busway system.

Table 16.1

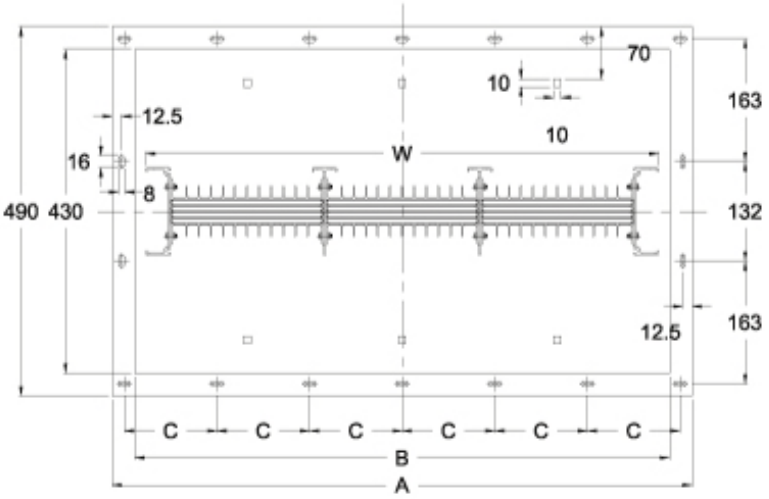

Fig. 18.3

Physical Data

Plug-in Unit

Powerduct plug-in unit is available from rating 15A to 800A with different levels of fault protection. A maximum ten pieces of 400A (max) plug-in unit ≤ can be mounted on a standard 3050mm plug-in busway. The **maximum** amperage carried by **each plug-in opening is 400A**. Therefore, 500A ~ 800A will accommodate two openings.

Safety Features:

Powerduct plug-in unit features mechanical interlock system. This is to prevent the insertion or removal when the plug-in unit is in "ON" position (energizing).
(Fig. 19.2)

The front operating switch allows padlocking at the "OFF" position. This is to prevent switching to "ON" accidentally during servicing and maintenance. The plug-in earth contact is being designed so that the earth contact is made prior contact to the LIVE busway during installation. Besides, it also features water resistant capability to suit customers' need. The plug-in unit is rated from IP40 as standard but customers can order IP55 as optional.

Refer to the table 19.1 for the sizes availability of the unit with ampere rating.

Table 19.1 Plug-in dimension

Ampere rating	Dimension mm		
	H	W	D
15 ~ 100	380	270	240
125 ~ 250	480	270	240

Physical Data

Plug In Unit

Safety Lock

Door Interlock– plug in door locked soon the operating switch is 'ON' position.

Mechanical Interlock with Busway Housing-The plug in cannot be attached or detached from the busway when the operating switch is 'ON'

Knock-out Hole

No knock-out hole is provided. Make it at site in conformity with the cable size.

Grounding

Plug in enclosures shall make positive ground connection to the busway housing prior to the bus bar contact.

Physical Data

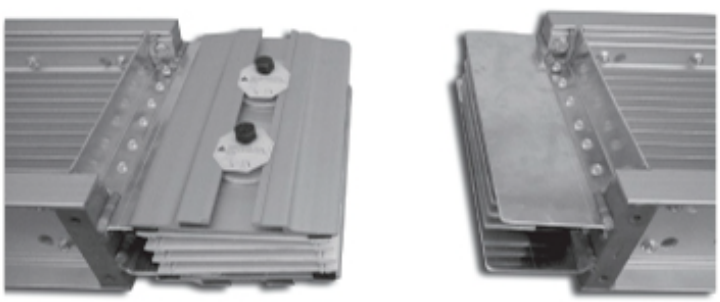
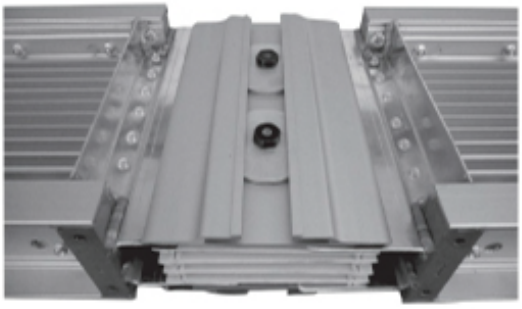
Joint Stack

Powerduct joint stack features a single bolt with double headed design. The high strength steel bolts together with the Belleville spring washers provide equal pressure across the complete joint contact area to assure proper electrical contact. Double head bolt will shear off to ensure the proper torque is applied.

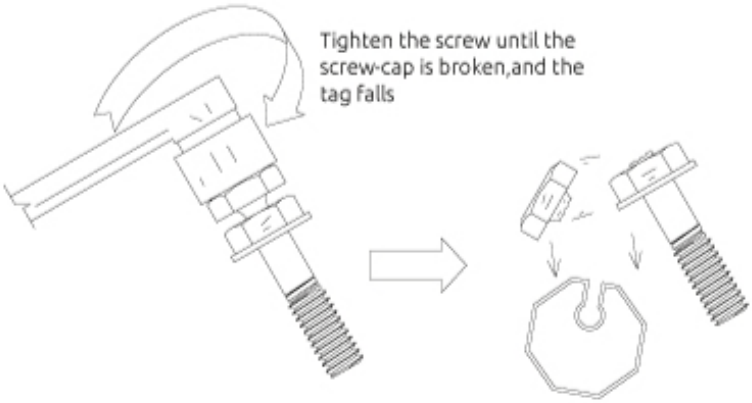
It is very important to get the joint installed properly and accurately. Improper tightening of the connection bolts will cause the joint overheating after certain period of time during energizing. Powerduct bolt is maintenance free design.



BEFORE



AFTER



Joint Detail

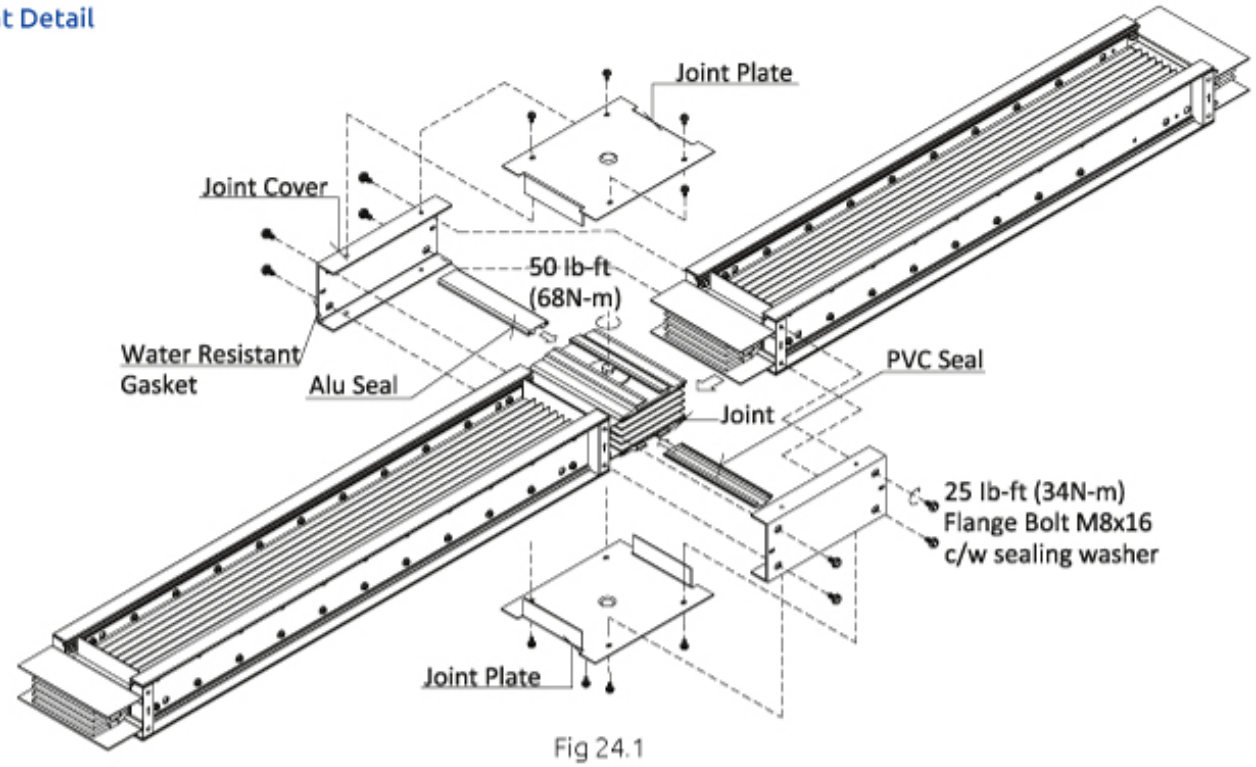


Fig 24.1

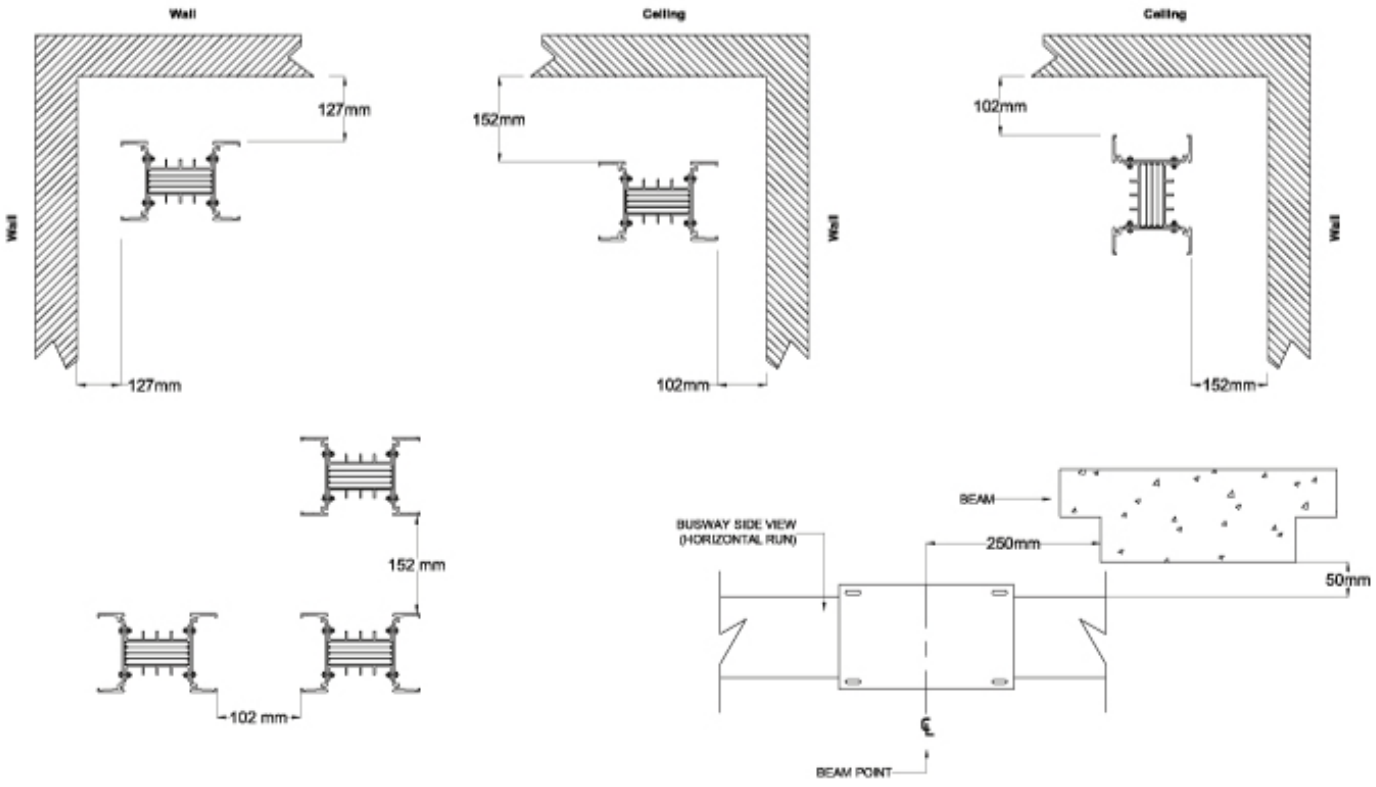
Feeder Busway Dimension Spacing Between Runs & Minimum Clearance

The minimum clearances for installing between feeder busway with wall, and ceiling are shown as the following picture below.

Additional clearance may required for the plug-in devices installation. Refer to the next page.

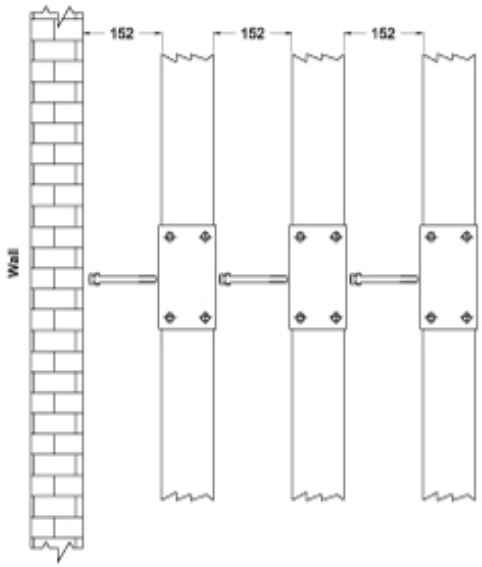


Minimum Distance between parallel-installed busway

Feeder Busway

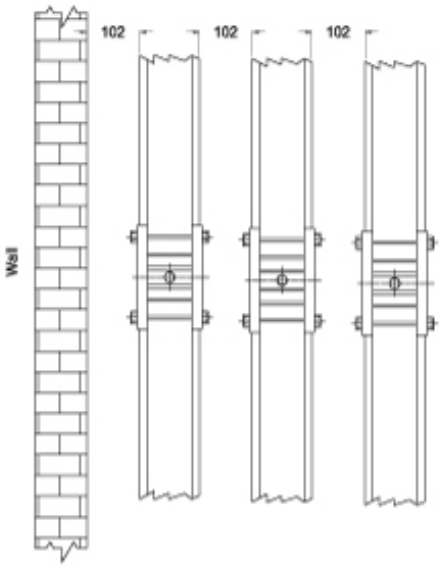
In case the busway been installed side by side.

(Flatwise Installation)



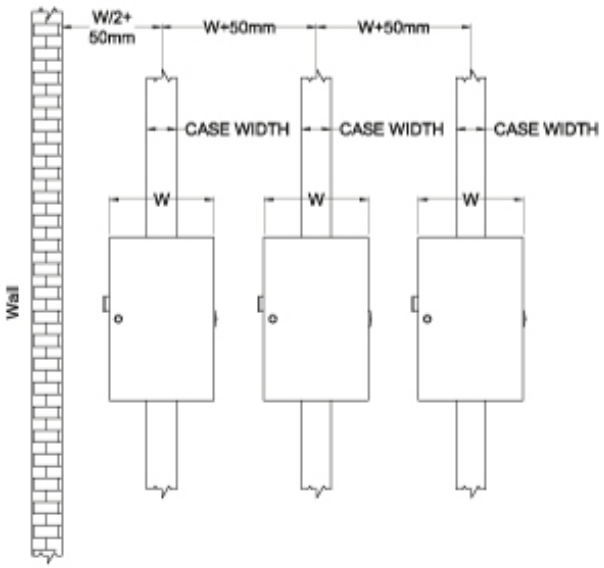
In case the busway been installed side by side.

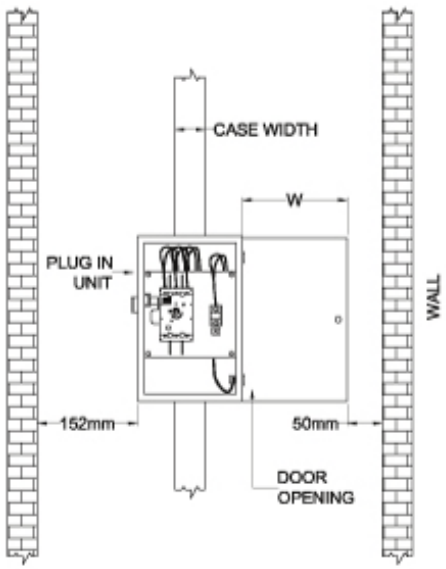
(Edgewise Installation)



Plug-in type

Minimum clearance of plug-in busway installed in parallel is shown as below. The minimum clearance shall be determined between the plug-in to ensure that 50mm clearance is given. When the busway is to be installed in a tight places, make sure clearance shall be given enough for the plug-in to get opened which is shown as picture below:





Note

* Dimensions 'D', 'H', 'W' refer to the dimensions table on 19.1

Busway Connection Procedure:

1. Align the sections to be joined by matching up the TOP labels attached to the ends of each section. Use tools provided by manufacturer to ease the installation. Ref. Fig.26.1 and 26.2
2. Slide the sections together.
3. If the joint caps are not already in place, reattach them and hand tighten the mounting screws.
4. Inspect the busway run for straightness in all planes and make any adjustments necessary for good alignment.
5. Tighten the joint bolt to 50 ft-lbs (68N-m) with a 3/4 inch or 19mm socket wretch. When the Belleville washers on both sides are flattened, the bolt is fully tightened. If the double head bolt is used, tighten until the bolt head shear off. (No torque wrench is required) as shown in fig.26.3
6. Tighten all joint cover flange bolt (M18x16) to 25lb-ft (34N-m) with a 13-mm socket wrench.
7. During the installation, occasionally mega test the assembly to check for any improperly made joints. Resistance should not drop below 1 megaohm per 100 feet of busway. (According to NEMA BU 1)
8. Mega test the complete run before energizing.

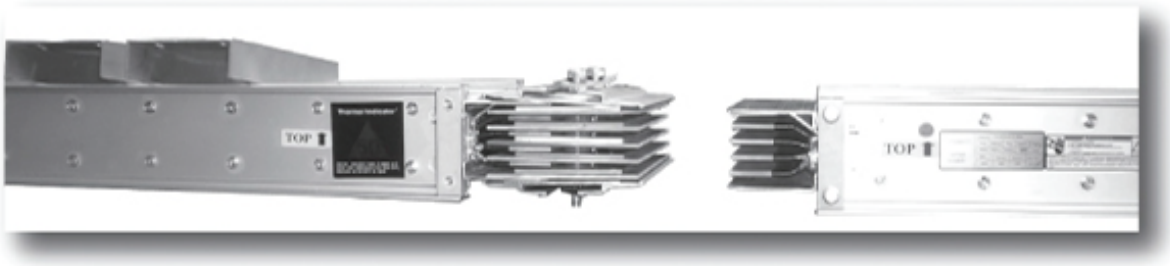


Fig. 26.1

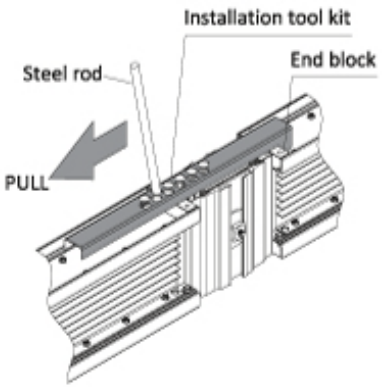

Fig. 26.2

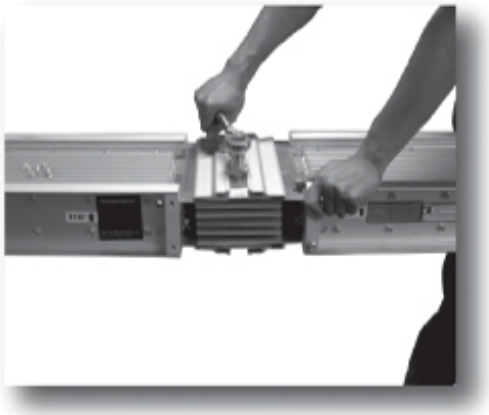

Fig. 26.3

Hangers

Application for horizontal Mounting, cleats shall be mounted for installation at 2 meter intervals. The installer just install all these cleats in the angle irons or U channels to mount the busway at horizontal edgewise or flatwise. In addition, 1/2 inch (12mm) drop rods are recommended with a maximum 10 foot (3840mm) spacing. Drop rods and other hardware must be furnished by the installer.

Please check with manufacturer if cleat quantity provided is insufficient.

Important :

- Maintain good alignment of the drop rods along the busway run.
- Do not support busway at the joint.
- After the busway is secured with the hangers, adjust the hangers on the rods for the correct elevation.
- Busway braces (furnished by the installer) may be required to keep the run straight or to prevent rotation.
- Manufacturer strongly recommends each 2 meter busway adjacent must have busway cleat supported.

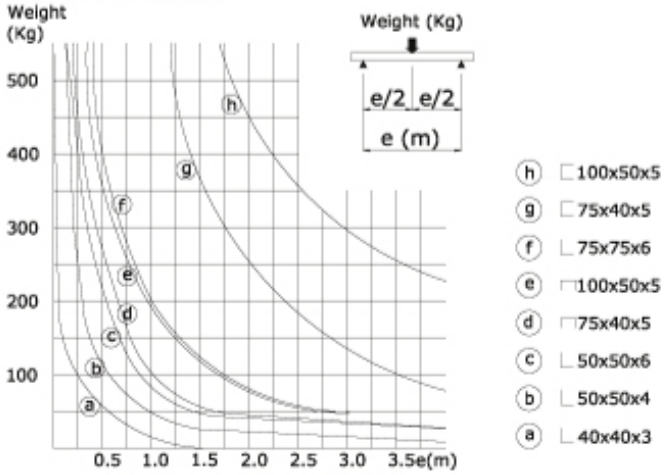
Material use for busway support channel.

- Suggest to use 12mm or 1/2 inch of steel rod.
- It is recommended to use 40x40x3(mm) support channel for 2000A or below busway model while 50x50x6(mm) for 2500A or above busway.
- Please refer to below data during busway installation

Refer to the Table 9.1



Floor Support

Spring Hanger is purposely design to support busway at each floor regardless the busway total length.
Intermediate support suggests to be use whenever the floor to floor lever is over 4.8M height.
The number of spring provided is based on busway weight.

W = Busway width

Job Reference

Fire Rated Powerduct busway system is also available, Fire Rated Powerduct is specially designed upon customer's request where the applications in hazardous environment system. The rating available from 400A to 6300A. The design and construction is completely tested accordance to IEC 60331-1:2009, BS 6387:2013(C,W,Z) / IEC 61034:2005 (measurement of smoke density).

IEC 60331-1:2009

The busbars provide circuit integrity for 120 minutes at 830°C.

BS 6387:2013 / IEC 61034:2005

The busbars provide circuit integrity for :

- Protocol C - Resistance to fire alone
- Protocol W - Resistance to fire with water
- Protocol Z - Resistance to fire with mechanical check.

The busbars provide measurement of smoke density.
